IBM Series/ 1
Customer Site Preparation Manual

## Federal Communications Commission (FCC) Statement

Warning: This equipment generates, uses and can radiate radio frequency energy and if not installed and used in accordance with the instructions manual, may cause interference to radio communications. It has been tested and found to comply with the limits for a Class A computing device pursuant to Subpart $\mathbf{J}$ of Part 15 of FCC Rules, which are designed to provide reasonable protection against such interference when operated in a commercial environment. Operation of this equipment in a residential area is likely to cause interference in which case the user at his own expense will be required to take whatever measures may be required to correct the interference.

Ninth Edition (June 1986)
This is a major revision of, and obsoletes, GA34-0050-7. Due to the many changes and additions, this manual should be read in its entirety.

Use this publication only for the purpose stated in the preface.
Changes are periodically made to the information herein; any such changes will be reported in subsequent revisions or Technical Newsletters.

It is possible that this material may contain reference to, or information about, IBM products (machines and programs), programming, or services which are not announced in your country. Such references or information must not be construed to mean that IBM intends to announce such IBM products, programming, or services in your country.

Publications are not stocked at the address given below. Requests for copies of IBM publications should be made to your IBM representative or the IBM branch office serving your locality.

This publication could contain technical inaccuracies or typographical errors. A form for readers' comments is provided at the back of this publication. If the form has been removed, address your comments to IBM Corporation, Information Development, Department 27U, P.O. Box 1328, Internal Zip 1803, Boca Raton, Florida 33429-3405. IBM may use and distribute any of the information you supply in any way it believes appropriate without incurring any obligation whatever. You may, of course, continue to use the information you supply.

## Preface

This manual is a do-it-yourself guide to customer site preparation for the IBM Series/1. It is for use by customers and vendors whose job is planning for the physical installation of the Series/1. The major topics of this manual are site selection, site environment, site safety, electrical power and grounding, data communications, user-equipment wiring, and unit specifications. The user of this manual is not required to have any experience with computers.

Information in this manual was prepared with the assistance of IBM Installation Support Representatives who are experienced in helping IBM customers with site preparation.

## Ordering information...

This manual is available with a binder and a set of divider pages (with tabs) under order number GBOF-3975.

- The manual, binder, and tabs can be ordered separately under the following order numbers...
- Manual GA34-0050
- Tabs GX34-0050
- Binder G580-0082

Requests for copies of IBM publications should be made to your IBM representative or to the IBM branch office in your locality.

## Contents

Chapter 1. Introduction 1-1
Introduction to site preparation 1-1
Series/1—what is it? 1-1
Preparing for Series/1 1-2
When does it have to be done? 1-2
Who does what? 1-2
How this manual can assist you 1-3
Scheduling site preparation 1-4
Accessories and Supplies 1-9
Chapter 2. Site selection 2-1
Selecting an appropriate site 2-1
What's coming? 2-5
What's it for? 2-7
Work Flow 2-7
Other equipment 2-7
Space needed? 2-7
Floor-layout plan 2-7
What about the floor? 2-11
Electrical power needed? 2-12
What about the surroundings? 2-14
Safe and secure? 2-14

Chapter 3. Site environment 3-1
Environmental Conditions 3-1
Temperature and humidity 3-1
Air quality 3-4
Vibration and Shock 3-7
Altitude 3-7

Chapter 4. Site Safety 4-1
A word about safety 4-1
Safety standards 4-1
Hazardous locations 4-1

## Chapter 1. Introduction

## Introduction to site preparation

Series/1—what is it?

The Series/ 1 is a small, modular computer system. Units for the Series/1 include processors, disk/diskette storage, printers, keyboard-display stations, data communications, sensor input/output (I/O), and various features for connecting user equipment.

## Preparing for Series/1

Once you have ordered the Series/1, the next step is preparing your location for its arrival and installation. Site preparation (sometimes called physical planning or installation planning) is your job. It is an important job.

With proper site preparation, your Series/ 1 can be installed quickly and efficiently. If proper preparations are made before your computer arrives, you can unpack the units, position them where they are to be installed, and be ready for installation by the IBM customer service representative (CSR).

Most important of all, proper preparation will help your company realize the benefits you expect from your new computer.

## When does it have to be done?

Because site preparation is so important, it can't wait. To do the job well and on time, you must follow a schedule. With a schedule, you can "countdown" from order to arrival, doing your preparation work in an orderly sequence. This manual will help you with site preparation scheduling.

## Who does what?

Although site preparation for Series/1 is your responsibility, you may need outside help with some tasks. The procedures in this manual include recommendations and directions for professional assistance with certain site-preparation tasks.

Your job includes arranging for any help you might need from consultants, contractors, or vendors. For example, if your Series/1 has communication features, you may need to arrange with your local communications company to install telephone lines and other communication equipment before the computer arrives. If your Series/ 1 has features for attachment to your equipment, you may need to arrange for outside help to plan and install the necessary wiring.

While the responsibility for site preparation is yours, IBM assistance with site-preparation planning is available at the current hourly rate.

When your Series/1 arrives, you are responsible for unpacking and placing it in position for installation by the IBM customer service representative. After the IBM customer service representative has switched power on to the computer and checked the computer out, you are responsible for connecting customer setup units such as the 3101 terminal, 4975 printer, 4980 Display Station and other equipment (sensor wiring, communication cables, and other wiring) to the computer.

## How this manual can assist you

This manual is designed to assist you in effectively preparing your site for Series/1. Therefore, we urge you to get to know this manual well and to use it!

The instructions in this manual are organized according to the major site-preparation tasks, with each major task as a chapter. The task chapters are separated by divider pages, with the chapter names on the divider tabs. Therefore, you can easily find the instructions for each part of your job by using the tabs on the side of the manual.

The chapter topics are:

- Introduction
- Site selection
- Site environment
- Site safety
- Unit specifications
- Data communications
- Electrical power and grounding
- User-equipment wiring
- Supporting information.

To get maximum benefit from this manual, first scan the entire manual to become familiar with all site-preparation tasks. Then read and understand the instructions for each specific task-before starting to work on it. Be sure to follow the instructions closely.

Since you probably will have several of your people and/or contractors assisting with this job, make sure that everyone follows the instructions contained in this manual.

If your Series/ 1 system has other IBM equipment attached, refer to Chapter 9 for a list of manuals containing physical planning information.

## Scheduling site preparation

Once your company has ordered Series/ 1 and a delivery date has been confirmed, you should begin site preparation to ensure a smooth installation. Good site preparation requires a project leader or manager to oversee all preparation tasks, detailed action plans, and adherence to the schedule.

Delivery schedules and the time required to prepare a site for Series/1 installation can vary. You should obtain the actual scheduled delivery date for your Series/ 1 from your IBM Marketing Representative. Your site-preparation schedule should then be tailored to your actual delivery date.

The site-preparation schedule is what a typical schedule might look like. It is based on 15 -weeks from order to delivery-starting with the 15th week and "counting down" to week 1 , when the computer is actually delivered and installed.

Use this schedule in any way that might help you to schedule your site-preparation job. However, note that the "who does" column is the same for any schedule.

Also included with the site-preparation scheduling worksheet is a blank worksheet that you may remove or copy to assist in developing your schedule.

| Sample site-preparation schedule (part 1 of 3) |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Week | Schedule date | Who does it? |  | Date completed | Site-preparation tasks |
|  |  | Customer | IBM |  |  |
| 15 |  |  | - |  | Identify the project manager who will be responsible for all site-preparation tasks. <br> Prepare action plans and detailed schedules. <br> Plan training program for customer employees. <br> Begin site selection. |
| 14 |  |  | - |  | - Review overall site-preparation plans with IBM marketing representative. <br> Identify: <br> The need for data communication equipment and wiring.* <br> The need for user-equipment wiring (such as sensors).* The need for cables for the various peripherals and all other cables for devices such as 5250 Display Stations, 3101 Display Terminal, 5230 Data Collection Units. |
| 13 |  | - |  | - | Complete the site-selection tasks (including floor-layout plan showing location of all Series/1 units, user equipment, furniture, and storage). |
| 12 |  | - <br> - <br> - |  |  | Order: <br> Communication equipment and wiring for arrival by week 8.* Decide who will install. User-equipment wiring for arrival by week 8.* Decide who will install. <br> Schedule: <br> Site alterations. Decide who will do the work. <br> Training program for customer employees. |
| 11 |  | - |  | - | Verify availability of equipment and services needed for each installation task. |

*If necessary, IBM can provide assistance through the Special Product Engineering Services Department (Boca Raton, FL).

| Sample site-preparation schedule (part 2 of 3) |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Week | Schedule date | Who does it? |  | Date completed | Site-preparation tasks |
|  |  | Customer | IBM |  |  |
| 10 | $\qquad$ |  |  |  | Complete: <br> - Electrical power layout. <br> - User-equipment wiring layout.* <br> - Communications equipment wiring layout.* |
| 9 |  | - |  |  | Order supplies (such as paper, magnetic tape, diskettes, and ribbons). |
| 8 |  |  |  | - | Review site-preparation plans for any schedule problems. Take action to keep on schedule. <br> Schedule: <br> Communication equipment and wiring installation.* <br> User-equipment wiring installation.* |
| 7 |  | - |  |  | Start installation of power outlets for Series/1. |
| 6 |  | - |  |  | Verify all equipment ordered is on site or on a firm delivery schedule. |
| 5 |  | - |  |  | Review overall progress of site preparation with IBM marketing representative. |
| 4 |  |  |  |  | Check receipt of supplies (such as paper and ribbons). Complete employee training. |
| 3 |  |  |  |  | Complete installation of: <br> - Power outlets and verify required Series/1 voltages. <br> Communications equipment and wiring, and check it out.* User-equipment and customer installed wiring, and test for proper termination, routing, and grounding.* |
| 2 |  | - |  |  | Complete check-out of entire site (including site alterations, safety, and environmental equipment and procedures). |

[^0]| Sample site-preparation schedule (part 3 of 3) |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Week | $\begin{array}{l}\text { Schedule }\end{array}$ <br> date | Who does it? |  | Date completed | Site-preparation tasks |
|  |  | Cust- <br> omer | IBM |  |  |
| 1 |  |  | - |  | - Site preparation complete. <br> - Series/1 units delivered. <br> - Unpack Series/l units and move to installation site. <br> Unpack customer setup units and move to installation site. <br> - Call IBM customer engineer. <br> - IBM customer engineer on site to complete IBM installation tasks (powering on and checking out Series/1). <br> IBM customer engineer turns Series/ 1 over to customer. <br> - Connect user-equipment and communication wiring to the computer.* |

*If necessary, IBM can provide assistance through the Special Product Engineering Services Department (Boca Raton, FL).

Purpose: Use this worksheet for detailed site-preparation scheduling, or for tailoring the typical site-preparation schedule to your particular situation.

## Chapter 2. Site selection

## Selecting an appropriate site

One of the most important tasks involved in preparing your location for Series/ 1 is selecting a site.

Some important things to consider in selecting a site are:

- The equipment on order
- What the equipment will be used for and how close it should be to the work it will do
- Space needed for the equipment, including operating and servicing
- Floor strength and covering
- Site environment, such as temperature, and humidity
- The electrical power needed
- Safety and security.

Figure 2-1. (Part 3 of 3) Series/1 machine units

## What's coming?

The first thing you need to know is what equipment is coming. Figure 2-1 shows some of the available Series/ 1 machine units.

To begin site selection, you should make copies of the product-specification worksheet (Figure 2-2 on the following page).

Next, from your company's copy of the Series/ 1 purchase agreement, find out what specific Series/1 units are on order.

On the product-specification worksheet, list all the units (products) on order by type, model, and quantity ( $\square 1$ below). Be sure to use a separate worksheet for each Series/ 1 System to be installed in any one location.

Now refer to the unit specifications chart in Chapter 5 of this manual for the information needed to fill in the remainder of the worksheet ( 2 ? below)

Use the Information on this worksheet for site selection as well as for other site-preparation tasks.
(1)

Product-specification worksheet

| Product (machine) |  |  | Power load (kVA) |  | Heat/output (Btu/hr) |  | Weight <br> (lb) |  | Voltage | Notes |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Product-specification worksheet

Figure 2-2. Product-specification worksheet

## What's it for?

Once you know what equipment is coming and have filled in the prod-uct-specification worksheet, the next step is to consider how the the equipment will be used. This is important in helping make the best site selection. Items to consider follow.

## Work Flow

The location of your Series/1 may affect the efficiency of your company's business. Someone may have already considered this and selected a location conducive to efficient work flow. If a site has not been selected, you should explore the matter of efficient work flow before selecting a site.

## Other equipment

Will Series/ 1 control some of your production equipment? If so, the location selected can affect the efficiency of your operation. For example, placing your computer as close as possible to your production equipment gives you better electrical-signal quality as well as a less-expensive hookup.

## Space needed?

After reviewing the equipment on order, its use and proximity to its task, you should have a general idea of where to place it. The next step is to prepare a floor-layout plan to ensure that your Series/1 units will actually fit into the selected location with enough room for operating and servicing.

## Floor-layout plan

To prepare a floor layout do the following:

1. Mark off the dimensions of your site on grid paper, using
either a metric or an English scale.

The sample floor-layout plans shown in this chapter (Figures 2-3, 2-4, and 2-5) are in English units ( $1 / 2$ inch $=1$ foot). A $1 / 4$ inch $=1$ foot and a $1 / 2$ inch $=1$ foot layout template is provided in chapter 9 of this manual.
2. Make as many copies as you need of the appropriate floor-layout templates from Chapter 5.
3. Cut the templates out and position them on the grid paper. This helps determine if your units fit in the available space. It also helps you decide the best arrangement for servicing and operating the machines.

The service clearance for the 4997 Rack Enclosure takes care of the service clearance needed for rack-mounted Series/ 1 units. Service clearance is required for the stand-alone 4952-C Processor and 4973 Printer, but not for the 4974 or 4975 Printers, or 4978 or 4979 Displays, since these units can be easily moved for servicing.
4. Include all other items - such as desks, tables, storage, and other equipment - in the layout. Also, consider the space taken by supporting columns or other room fixtures. Draw all these items to scale on the grid paper. For a typical system, storage space should be reserved for five 279 mm x 432 mm (11 in. x 17 in.) logic binders with 51 mm (2in.) rings. Larger systems may have up to seven binders.
5. Consider the physical limitations and the routing of the signal cables for the 4973, 4974 and 4975 Printers, the 4978 and 4979 Display Stations, and the 3101 Display Terminal, 5250 Display Terminal, 5250 Display Stations, and 5230 Data Collection Units.
6. When doing your floor layout, consider the power-cord length and the space required for cabling to the computer. More detailed information on this follows in this chapter under "Electrical Power Needed."
7. Consider the potential safety hazard from power and signal cables routed over the floor.
8. See Figures 2-3, 2-4, 2-5 for sample floor layout plans.
9. When estimating the cable length required to connect an external device to an IBM processor, 4965, or I/O Expansion Unit feature installed in a 4997 Enclosure, allow 2-2.5 m (6-8 ft) for a 4997-2 and $1.5-2.0 \mathrm{~m}$ (4-6 ft) for a 4997-1, for cable routing through the enclosure.

Figure 2-3. Sample floor layout for single rack enclosure

Figure 2-4. Sample floor layout for multiple rack enclosures

## What about the floor?

## Floor Loading

Having decided on a room with adequate space for Series/1, you must also consider the strength of the floor (floor loading). Your site floor should support Series/1 with no difficulty-but you should be sure.

To find out if your floor is strong enough for Series/ 1 do the following:

1. Refer to the product-specification worksheet (filled out earlier) for the total weight of your Series/1 units.
2. To the total weight of the Series/ 1 units, add the total weight of all other items in the room (such as furniture, supplies, other equipment, and cables).
3. Contact someone in your company (such as the building engineer) who can determine whether the floor can support the additional weight. Generally, it takes a structural engineer to accurately calculate floor loading.

Special information on floor loading...

- If more than three Series / 1 rack enclosures are placed side by side, no allowance should be taken for clearance at the ends of the two outer rack enclosures in calculating the floor loading.
- Regardless of the actual service clearance required, the clearance used in actual floor-loading calculations cannot be more than 760 mm ( 30 in ) in any one direction from the machine.
- $98 \mathrm{~kg} / \mathrm{m}^{2}(20 \mathrm{lb} / \mathrm{sq} \mathrm{ft})$ of the service area used in calculating floor loading must be applied as live load.
For a false or raised floor, 49 $\mathrm{kg} / \mathrm{m}^{2}(10 \mathrm{lb} / \mathrm{sq} \mathrm{ft})$ of total area used in calculating floor loading must be applied as false-floor load.

Note: Using the IBM method of calculating floor loading, a Series/1 with three or more 4997 Rack Enclosures fully loaded with machines may exceed $367.5 \mathrm{~kg} / \mathrm{m}^{2}$ ( $75 \mathrm{lb} / \mathrm{sq} \mathrm{ft}$ ). Such an installation should be reviewed by a qualified consultant.

## Floor covering

Floor-covering materials, such as tile and carpet, can cause a buildup of static electrical charge on people and furniture. When "charged" people or furniture touch grounded metal surfaces-such as the computer frame-the static buildup discharges. This discharge can cause discomfort and can also result in computer failure.

To avoid these problems, the floor covering for your site should be antistatic. Existing carpets can be treated with antistatic solution. Whether or not your floor covering is antistatic, a proven method of controlling static buildup is by maintaining $40 \%$ to $50 \%$ relative humidity at your site.

## Special information on testing

 floor-covering resistance...If you suspect that your floor covering might give you static charge problems, you can check the resistance of the floor-covering material (or have someone do it for you).

The resistance of floor covering should not be more than $2 \times 10^{10}$ ohms or less than 150,000 ohms, when measured with a megohmmeter and a test-electrode kit.

Refer to applicable national and local safety standards for the testing procedures. (For installations in the U.S., see Chapter 9 of this manual.)

## Electrical power needed?

Before you can finish your
floor-layout plan and make your
final decision on a site, you must also consider the electrical power required for your Series/1. The following paragraphs tell you how to plan for power outlets; Chapter 7 tells you what power you need at the outlets.

Series/ 1 rack enclosures and stand-alone units (displays, printers, and 4952-C with stand-alone enclosure) have power cords that connect to your outlets. A separate power outlet on its own branch circuit is required for each rack enclosure and each stand-alone unit.

Refer to Chapter 7 of this manual for additional information on power and grounding. Thoroughly review the information in Chapter 7 before making your final decision on site selection. The power you need may not be available at the site you have in mind. After you have reviewed Chapter 7, you should be able to determine if you have the right power available at your site, or if it can be installed with no major problems.

Now go back to your floor-layout plan. Indicate on the plan where you need outlets for your Series/1 units. Be sure to consider the length of the power cords for the rack enclosures and stand-alone units, as shown in Figure 2-5.

Arrange your equipment and outlets so that the power cords are not a tripping hazard.

You also need to plan for power required by any other equipment in the area.
 or power and grounding, and chapter 9 for power-outlet specifications.

Notes...
In countries other than the U.S. and Canada, Series/I rack enclosures and stand-alone units may be shipped without power plugs attached to the power cords. Some national or local safety standards may require a different type of plug, or direct wiring of the Series/I power cords (instead of a plug-in connection).

Figure 2-5. Sample floor layout showing power outlets for Series/1

## What about the surroundings?

A very important item to consider in selecting and preparing your Series/ 1 site is the condition of your site environment. Site environment refers to temperature, humidity, air quality, vibration, and shock.

Series/ 1 is best suited to business offices and clean industrial locations.

If your site does not meet the standards for which Series/1 was designed, you may have to either pick another site or do some things to improve the environment (such as air conditioning and humidity control).

See Chapter 3 of this manual for additional information on checking the environment at your site and what you can do if there are problems.

## Safe and secure?

A very important item to consider in selecting any Series $/ 1$ site is safety. Following the guidelines of your company's safety program will help you decide if the site you have in mind for Series/1 is safe.

There are, however, some safety concerns for computer installations that require special emphasis. These are explained in Chapter 4 of this manual. Review Chapter 4 thor-
oughly to help you determine if you have planned for maximum safety.

The security of the site you select is really a matter of the value that your company places on its assets. In selecting a site for Series $/ 1$, you should follow the guidelines of your company for protecting equipment and information.

Computer installations may, however, require some special consideration for protection of the information (data) that the computers process. Talk to the people who will be using the computer at your site to see if there are any special security precautions you should take.

Some of the items that your company should consider regarding physical security are as follows:

- Controlling the entry of people into the area.
- Secure the area with adequate door locks.
- Storing computer records in secure and fire-safe storage areas.
- Clearly defining responsibility and procedures for people using the computer.
- Developing both backup and recovery procedures in case something goes wrong (such as fire, storm, and flood).

## Chapter 3. Site environment

## Environmental Conditions

The environmental conditions at your site are very important to the successful installation and operation of your Series/1. The environmental conditions of most importance in selecting and preparing a Series/1 site are...

- Temperature and humidity
- Air quality
- Vibration and shock.

For most of these items, there is an ideal (or optimum) condition, along with acceptable conditions above and below ideal. For example, the ideal temperature range for most Series/ 1 units is $22.2^{\circ}$ to $25.6^{\circ} \mathrm{C}\left(72^{\circ}\right.$ to $\left.78^{\circ} \mathrm{F}\right)$, while the acceptable temperature range is $10.0^{\circ}$ to $40.6^{\circ} \mathrm{C}$ ( $50^{\circ}$ to $105^{\circ} \mathrm{F}$ ).

Where environmental conditions are outside the acceptable range, you must take steps (such as installing air conditioning) to bring the condition within the acceptable range or closer to the ideal condition.

The main purposes of this chapter are to:

- Help you check your site for proper environmental conditions.
- Give you guidance on what can be done when the proper conditions are not met.

## Temporature and humidity

The ideal environment for Series/1 is $22.2^{\circ}$ to $25.6^{\circ} \mathrm{C}\left(72^{\circ}\right.$ to $\left.78^{\circ} \mathrm{F}\right)$ with $40 \%$ to $50 \%$ relative humidity. Acceptable ranges (upper and lower limits) of temperature and relative humidity for each Series/1 unit and peripheral environment are given in the unit-specification charts in Chapter 5 of this manual. Refer to Chapter 9 for the order numbers of non-Series/ 1 units physical planning manuals.

To check the temperature and humidity at your site, consider the following:

- The present (existing) environment at the site with Series/ 1 not installed, or installed but not powered on.
- The environment at the site with Series $/ 1$ installed and powered on.

The existing site environment should be within the "non-operating environment" range shown in the Series/1 unit-specification charts in Chapter 5. This is important because you can damage your computer by powering it on in conditions outside the specified range.

When Series/1 is installed and powered on the conditions of your existing environment change. Series/ 1 heat output will affect the temperature and humidity of your existing environment. Therefore, when Series $/ 1$ is powered on, your site environment should be within the "operating environment" range shown in the Series/ 1 unit-specification charts in Chapter 5. Again, Series/1 might fail or cause errors if operated at conditions outside the specified range.

Temperature and humidity check-out procedure...

Check the existing environment at your site...

- Measure the temperature.
- Measure the humidity.
- Compare these values to the nonoperating specifications given in Chapter 8.
[2]
Check the operating environment at your site considering Series/1 installed and powered on...
- Start with the existing temperature and humidity.
- Calculate the heat load of the existing environment.
- Add the heat load of Series/1 units.
- Calculate the operating temperature and humidity.
- Compare these values to the operating specifications given in Chapter 8.
[8]
Find a solution to the temperature and humidity problems if they are outside the specified ranges.

Checking the Existing Environment
In checking your existing site environment, first measure the temperature and humidity. The best device to use for this measurement is a thermohumidigraph. This device records temperature and humidity on a chart over a period of time, such as days or weeks.

A psychrometer can also be used to measure temperature and relative humidity. With a psychrometer, room temperature is read directly from the dry bulb. Humidity is calculated from the difference between the dry-bulb and wet-bulb readings. Several readings must be taken over a period of time to get a true measurement of changes in temperature and humidity.

If you are unfamiliar with these devices and readings, you should consult an air-conditioning expert.

Next, compare the temperature and humidity readings of your existing site with the operating ranges in the unit-specification charts in Chapter 5 of this manual. If your site readings are outside the operating range, you must take steps to bring the temperature and humidity within the specified range. For further information, refer to the section in this chapter entitled "Fixing Temperature and Humidity Problems."

## Checking the Operating Environment

The existing temperature and humidity readings from your site are not enough to determine if it will meet operating specifications when the Series/ 1 is installed and operating.

You must also consider the heat output (heat load) of Series/1 units. That is, you must add the total machine heat output (from your product-specification worksheet) to the heat load of your existing site.

There are, however, other considerations which must be included in calculating the heat load (such as building construction, window location, people, and lights). Because these items vary from one site to another, you should consult an air-conditioning expert to calculate your total-site heat load.

> Existing-site heat load +
> Total Series $/ 1$ heat-output $/ \mathrm{hr}$
> $=$
> Total-site heat load

Once the total heat load of your site is known, an air-conditioning
expert can determine the projected operating temperature and humidity of your site. You can then compare these values to the operating-environment specifications given in the unit-specification charts in Chapter 5.

Fixing Temperature and Humidity Problems

If the temperature and humidity of your site can be held within the specified ranges during Series/1 operation, new or additional air conditioning or humidity control is not needed.

One consideration you should make is, that although a large open room may not require new or additional cooling for Series $/ 1$, the additional heat may cause discomfort to people in the area.

Problems with temperature and humidity can be complex. If your site environment is outside the temperature and humidity ranges specified in Chapter 5, we recommend that you consult an air-conditioning expert for solutions.

## Air quality

If you are installing Series/ 1 in a typical business office or clean industrial location, you probably do not have to worry about the quality of the surrounding air. However, if your site is unusually dirty or has a chemical odor, you should be concerned.

Air contamination (dirt or corrosive gases in the air) can be hazardous to people and hostile to computers and other equipment. Dirt and corrosive gases can corrode electronic components in a computer, causing computer failure or errors.

The following paragraphs discuss air quality to:

- Explain air contamination and the problems it causes.
- Guide you in checking your site for air contamination.
- Guide you in solving problems with air contamination.

What is air contamination?
Series/ 1 is designed for installation in a typical business office or clean industrial location, relatively free from corrosive gases and dust particles.

Gases-such as sulfur dioxide, nitrogen dioxide, ozone, and acidic gaseous chlorine-are known to cause corrosion and failure of electronic components. However, these are not the only corrosive gases that cause equipment problems.

If you have any reason to suspect the presence of a corrosive gas (for example, the presence of an odor), determine what contaminent is in the air and whether it is in high enough concentrations to be hostile to the Series $/ 1$.

In addition to gases, some industrial processes produce ultrafine solid particles in the air, sometimes called particulate contamination. These particles can settle (form dust) in surrounding areas, even though the process producing the particles may be some distance away. Particulates sometimes cause failures of circuits and contacts in electronic equipment.

The maximum levels of contamination allowable in a Series/1 environment are defined in the specification chart in this section. These specifications apply only to IBM equipment. For the safety and health of people at the site, refer to applicable national and local safety standards on air contamination. (For installations in the U.S., see Chapter 9 of this manual.)

Maximum levels of corrosive gas and particulates allowable in a general Series/ 1 environment...

Corrosive gas contaminants
Corrosive gas upper limit is expressed as arithmetic mean values (averages over one year) in $\mu \mathrm{g} / \mathrm{m}^{3}$ (micrograms per cubic meter) and ppb (parts per billion, $10^{9}$, by volume).

- Total Reactive Sulfur $=3.2 \mu \mathrm{~g} / \mathrm{m}^{3}$

This includes elemental sulfur vapor ( $\mathrm{S}_{8}$ ) of up to $2.1 \mu \mathrm{~g} / \mathrm{m}^{3}$. Total reactive sulfur is the quantity of elemental sulfur expressed in $\mu \mathrm{g} / \mathrm{m}^{3}$ in all gaseous species that reacts with silver to form silver sulfide (e.g., $\mathrm{S}_{8} \mathrm{H}_{2} \mathrm{~S}, \mathrm{CH}_{3} \mathrm{SH}$, etc., but not $\mathrm{SO}_{2}$ ). The $3.2 \mu \mathrm{~g} / \mathrm{m}^{3}$ of reactive sulfur is equivalent to $3.4 \mu \mathrm{~g} / \mathrm{m}^{3}$ or 2.5 ppb of $\mathrm{H}_{2} \mathrm{~S}$.

- Sulfur Dioxide $=262 \mu \mathrm{~g} / \mathrm{m}^{3}(100 \mathrm{ppb})$
- Nitrogen Dioxide $=141 \mu \mathrm{~g} / \mathrm{m}^{3}(75 \mathrm{ppb})$
- Ozone $=98 \mu \mathrm{~g} / \mathrm{m}^{3}(50 \mathrm{ppb})$
- Acidic Gaseous Chlorine $=3 \mu \mathrm{~g} / \mathrm{m}^{3}$

Acidic gaseous chlorine is the quantity of elemental chlorine expressed in $\mu \mathrm{g} / \mathrm{m}^{3}$ in chlorine containing acidic gases (e.g., $\mathrm{HCl}, \mathrm{Cl}_{2}, \mathrm{C1O}_{2}$, etc.). The $3 \mu \mathrm{~g} / \mathrm{m}^{3}$ is equivalent to 2 ppb of HCl or 1 ppb of $\mathrm{Cl}_{2}$.

## Particulate contaminants

Particulate upper limit is expressed as arithmetic mean values in $\mu \mathrm{g} / \mathrm{m}^{3}$ (micrograms per cubic meter) or $\mu \mathrm{g} / \mathrm{cm}^{2} / 30$ days (micrograms per square centimeter per 30 days).

- Suspended Particulates $=200 \mu \mathrm{~g} / \mathrm{m}^{3}$
- Benzene Soluble Organics $=30 \mu \mathrm{~g} / \mathrm{m}^{3}$
- Settleable Particulates $=1500 \mu \mathrm{~g} / \mathrm{cm}^{2} / 30$ days

## Testing for Air Contamination

Testing for gases and particles in the air that might be harmful to Series/1 involves special equipment and procedures. Unless someone in your company is qualified, we recommend that you consult an expert in this area.

IBM Installation Support Representatives (or Installation Planning Representatives) can take samples of air at customer sites and have the samples tested in a chemical laboratory. This service is available at the current hourly rate.

## Fixing Air-Contamination Problems

If testing of the air at your site reveals unacceptable levels of contamination, action must be taken. Some methods of correction are suggested below. However, an air-conditioning expert should be consulted before implementing any of these methods. These methods are:

- Filtering corrosive gases using a chemical-control filtration system such as an activated-carbon filter.
- Filtering particulates using a particle-control filtration system.
- Controlling the relative humidity-thus reducing the rate of corrosion.

This can be done by keeping the relative humidity at the low end of the $40 \%$ to $50 \%$ recommended range.

- Constructing a sealed, filtered room.

This method may be necessary for extremely contaminated environments. It involves constructing a totally enclosed room, supplying the room with clean outside or filtered air, and keeping the room pressurized.

You can purge and pressurize a room with a fan or separate air-conditioning unit that brings uncontaminated air into the room, and maintains a constant air flow from the room to the surrounding area. This process creates a higher air pressure in the room to maintain an outward air flow.

If the Series $/ 1$ is mounted in standard 19-inch racks another option would be a sealed rack enclosure with its own air conditioning (from appropriate vendors). Other provisions would be required for printers, display units, and other stand-alone units.

For more information, refer to the applicable national and local safety standards. (For installations in the U.S., see Chapter 9 of this manual.)

## Vibration and Shock

If you are installing Series/ 1 in a typical business office or clean industrial location, you may not have to worry about vibration and shock. Minor vibration, however, can cause the equipment to move. You may have to use pads to keep it in place.

To check vibration levels, use a standard vibration meter with acceleration and displacement scales. Such meters are available from vibration-equipment suppliers and instrument-rental companies.

Maximum vibration levels for a 4997 Rack Enclosure are a function of weight and can be determined from the charts in Chapter 9.

If your Series/ 1 site exceeds the vibration levels specified and you cannot relocate to a different area, you can overcome the problem by
mounting the Series/1 on shock-absorbing material or a shock-mounted pedestal. Individual unit vibration limits are found in Chapter 9.

You may need the assistance of a mechanical engineer to solve vibration problems.

## Altitude

All Series/1 units except the 4969 Models 7D, 7N, and 7P are designed to operate at nominal atmospheric pressure. Pressure measurements are ( $\pm 2.6 \%$ ) from sea level to 2135 m ( 7000 ft ). The 4969 Models 7D, 7N, and 7P can be installed to operate from sea level to $1524 \mathrm{~m}(5000 \mathrm{ft})$. At 1524 m ( 5000 ft ) the vacuum pump and other adjustments must be made for your specfic altitude. Contact your IBM Marketing representative for applications exceeding these limits.

## Chapter 4. Site Safety

## A word about safety

A very important part of site preparation is the attention given to safety. Always remember, safety involves people as well as property.

The purpose of this chapter is to guide you when making decisions about safety in preparing your site for Series/1.

## Safety standards

Series/1 is manufactured to meet the product-safety regulations and requirements of national testing laboratories, such as Underwriters Laboratories (UL) in the U.S.

In preparing your site for Series/1, however, you should follow all national and local safety standards (codes) that apply. (For installations in the U. S., see Chapter 9 of this manual).

## Hazardous locations

Series / 1 is not designed to operate in hazardous environments with a potentially explosive atmosphere.

If, however, you have to locate your Series/1 in a hazardous area, consult the applicable national and local safety standards. (See Chapter 9 for U.S. installations.)

Because of the many possible hazardous conditions, you may need to consult civil and chemical engineers on how to eliminate hazardous conditions at your site.

## Personal safety

Applying the guidelines of your safety program to your Series/ 1 site is a good starting point. The following items, however, deserve special attention.

## Safe Access

Plan for a safe-access route for people to get to and from your Series $/ 1$ site. A safe-access route is one that meets national and local safety standards.

A special route or customer guide may be necessary for IBM service people if they are unfamiliar with your company's safety procedures. You should also plan to include IBM service people in your safety-training program.

Putting up Safety Signs

Post signs for emergency and special safety procedures for your site in places that are easily seen. For example, if a Halon or $\mathrm{CO}^{2}$ total-flooding system is installed for fire control, you should post the appropriate warning signs.

Your local fire inspector can advise you on the type and appropriate location of safety signs.

## Outdoor cabling

## DANGER

During periods of lightning activity, do not install surge suppressons or cables, perform maintenance, connect or disconnect wires, or handle the surge suppressors in any way. The surge suppressors must be installed and grounded before outdoor cable is connected. As soon as outdoor cable is installed, it must be connected to the surge suppressors to ground the cable shield.

Personal safety requires that surge suppressors be installed on each outdoor or underground circuit run. Station protectors must be installed where cable enters or exits the building. They should be as close as possible to a suitable ground.

As defined by the National Electric Code (NEC), Article 500, station protectors must not be installed where combustible materials or other hazardous conditions exist; therefore, areas where cables enter and leave the building must meet NEC standards. Also the station protector must be grounded at the building entrance or exit point (reference Article 800-31 in NEC).

## Safe Site Construction

Walls, Ceilings, and Floors
Walls of a computer room should be noncombustible, fire-resistant, and extend from the floor to the ceiling. If outside walls are next to an area that can burn easily, installing shatterproof windows in the computer room will help protect people and equipment from flying debris and water damage. Sprinklers can also be installed externally over the windows to protect them with a blanket of water.

Where a false ceiling is installed, it should be noncombustible and fire-resistant. Steam and water pipes above the false ceiling should be inspected for leakage and condensation.

A raised floor, when installed, should also be noncombustible and fire-resistant. The space between the raised floor and regular floor should be cleared of dust and debris. If the regular floor is of combustible material, it should be protected by water sprinklers. The regular floor that supports the computer should also provide drainage.

## Air Conditioners

Because the blowers in an air-conditioning system can spread fire, special precautions should be taken with the air-handling units. Air filters should be noncombustible or fire-resistant. Fusible-link dampers should be provided to close off all air ducts leading to and from the computer site. The air-handling units for the computer site should be provided with emergency power-off controls in the computer room.

## Electrical Systems

Remote emergency power-off (EPO) controls may be required for disconnecting the electrical service to the computer area or room (see Chapter 7). EPO controls should disconnect power to the computer and to other equipment in the area or room, except lighting. These controls should be located close to the computer operator and, in the case of a computer room, close to the exits. Consult applicable national and local safety standards (see Chapter 9 for U.S. installations).

Proper grounding of the entire electrical system is a must (see Chapter 7).

Emergency lighting should be provided for the computer site. These lights should be battery-operated and should be designed to switch on automatically when normal electrical power is lost.

## Fire protection and control

In a computer site, the risk of fire is small if good housekeeping procedures are followed. If you need to store combustible material (paper and other supplies) in the area, plan to use totally enclosed metal cabinets designed for this purpose.

## Detecting a Fire

Detecting a fire early allows you more time to do something about it. Dependable fire-detection equipment is therefore very important for your Series/1 site.

There are several types of fire detectors-such as heat, smoke, and ionization (air-borne products of combustion) detectors. The advice of a professional from your own staff or a reputable dealer in this type of equipment may be required. Also consult national and local safety standards (see Chapter 9 for U.S. installations).

## Putting Out a Fire

Three types of fire-extinguishing equipment can be used in a computer area:

- Portable, hand-operated extinguishers
- Sprinkler systems
- Total-flooding systems ( $\mathrm{CO}^{2}$ or Halon gas).

You may use only one of the above or any combination of the three.

The portable, hand-operated extinguisher designed for use on electrical fires is usually sufficient for computer rooms. The size and quantity of portable extinguishers for your site can be determined by consulting national and local safety standards (see Chapter 9 for U.S. installations).

Sprinkler systems, if used, should be the dry-charged type. In such a system, the pipes are filled with air and the water that feeds the sprinkler pipes is controlled by an automatic valve with a time-delay mechanism. Thus, if a sprinkler head is accidentally opened, an alarm sounds to give you time to manually turn off the water. This prevents unnecessary water damage to your equipment.

If you have an existing sprinkler system and it is not the dry-charged type, you should have high-temperature sprinkler heads installed in the system at the computer location. These high-temperature heads help prevent unnecessary water damage to your equipment if a small fires occurs.

Total-flooding systems are effective only in a totally enclosed area. This system extinguishes a fire by flooding the area in a very short time with carbon dioxide $\left(\mathrm{CO}_{2}\right)$ or Halon gas. If this type of fire-extinguishing system is used, there are personal safety requirements that must be met. Refer to applicable national and local safety standards (see Chapter 9 for U.S. installations).

Suitable warning and evacuation procedures should be provided for an area with a total-flooding system. We recommend an immediate audible and visible alarm that provides a 30 -second delay before flooding occurs.

The IBM office servicing your equipment must be informed if a total-flooding system is used. IBM must then inform its people of a total-flooding system in any area in which they work and of the emergency procedures for that area. An IBM questionnaire will then be filled out by an IBM manager and a person from your company responsible for the safety of the total-flooding system.

## Battery safety

If you have ordered a 4999 Battery Backup Unit, you must supply your own battery and battery charger (see Chapter 7 of this manual).

A vented battery can be a safety hazard, especially when it is charging. You should take steps (such as warning signs) to keep flames, sparks, and smokers away. Such a battery can also cause corrosive damage to the computer or other equipment. We recommend that you use a sealed battery.

Be careful not to short-circuit the battery terminals or wires when servicing the battery.

## Shipping and Moving Safety

Series/1 units installed in a 4997 Rack Enclosure are shipped by various methods, depending upon the customer location and the units included.

A Model 2 Rack Enclosure with no units installed in the lower position ( 7 and 8 ) is shipped on a pallet in the U.S. and Canada (see Figure 4-1). Ballast is used instead of a pallet in other countries. A pallet or ballast is needed because the rack enclosure is top-heavy and unstable if tilted more than 12 degrees.

You may have a problem moving the unit on the pallet through doorways and hallways (see dimensions in Figure 4-1). Before removing the rack enclosure from the pallet or removing the ballast, read the caution label at the lower front of the rack enclosure.

A Model 2 Rack Enclosure with units installed in the lower positions (7 and 8) and all Model 1's are shipped without a pallet (see Figure $4-2$ ) and do not contain ballast. These rack enclosures, however, are unstable if tilted more than 12 degrees.

We recommended that you get a qualified mover to move the rack enclosure to your installation site.

## CAUTION

4997 Model 2 Rack Enclosure with no units installed in positions 7 and 8 ...

- Is shipped on pallet in the U.S. and Canada; contains ballast in other countries.
- Becomes unstable when tilted more than $12^{\circ}$ if pallet or ballast is removed. See caution label on rack enclosure.

4997
Rack Enclosure
Model 2

Maximum weight...

- With pallet, 286.4 kg ( 630 lb )
- With ballast, $358.4 \mathrm{~kg}(790 \mathrm{lb})$

Figure 4-1. Series/ 1 shipped with a pallet (or ballast)

Figure 4-2. Series/ 1 shipped without a pallet (or ballast)

## Chapter 5. Unit specifications

The specifications for each IBM Series/1 unit are listed in the following pages. A summary chart of all units is included. For each unit there is a plan view that shows dimensions, service clearances, cable entrances and exits, and the location of casters and leveling pads where applicable.

The symbols used in the plan views are shown in Figure 5-1.

Note: All Series/1 machine types are listed in U.L. report number E33252 as complying with U.L. Standard 478 as NFPA Type II computer equipment.

| $\square$ | Cable entry |
| :---: | :--- |
| + | Caster |
| $\bigcirc$ | Leveling pad |
| $\oplus$ | Power cable |
| $\theta \Theta$ | Service clearance |

Figure 5-1. Plan view symbols

## Environment

Temperature and relative humidity figures listed for each unit are maximum and minimum operating limits and are not to be construed as optimum operating points. The optimum operating environment for Series $/ 1$ is $22.2^{\circ}$ to $25.6^{\circ} \mathrm{C}\left(72^{\circ}\right.$ to $78^{\circ} \mathrm{F}$ ) and $40 \%$ to $50 \%$ relative humidity.

Air must flow freely through Series/1 units. The individual unit specification pages provide information about the required air flow. Unless otherwise stated, the fan blower assembly produces forced air cooling.

## Metric conversions

In this manual, English units converted into metric units are rounded to the nearest whole number or to the nearest decimal place given. Exceptions are kilograms ( kg ), watts, cubic meters per minute ( $\mathrm{m}^{3} / \mathrm{min}$ ), lumens per square meter (lumens $/ \mathrm{m}^{2}$ ), kilograms per square meter ( $\mathrm{kg} / \mathrm{m}^{2}$ ), pertaining to floor loading, and meters (m) pertaining to altitude; these are rounded to the $1 / 10$ / 50 rule.

To round according to the 1/10/50 rule:

1. When the number is less than 100 , round up to the next unit, for example, 23.2 or 23.7 becomes 24 .
2. When the number is greater than 100 and less than 1000 , round up to the next ten; for example, 163 becomes 170 .
3. When the number is greater than 1000 , round up to the next 50; for example, 1232 becomes 1250 .

## Abbreviations and Definitions

| A | ampere |
| :--- | :--- |
| ACC | asynchronous communication control |
| ambient | environment |
| AWG | American wire gauge |
| bps | bits per second |
| BSC | binary synchronous communication |
| BSM | basic storage module |
| BTU | British thermal unit |
| C | Celsius/coupler |
| CCITT | Consultant Committee of International Telephone \& Telegraph (WT) |
| CE | customer engineer |
| coax | coacial |
| cond | conductor |
| conn | connector |
| cont | continuous |
| DAA | Data Access Arrangement |
| dc | direct current |
| DCE | data communications equipment |
| DDA | Direct Disk Attachment |
| DI | digital input |
| dist | distribution |
| DO | digital output |
| dply | display |
| DPC | direct program control |
| DRC | data recording control |
| EIA | Electronic Industry Association |
| EPO | emergency power-off |
| F | Fahrenheit/front |
| ft | feet |
| Hz | hertz |
| in. | inch |
| I/O | input/output |
| kcal/hr |  |

Notes...

1. The given temperature and relative humidity are upper and lower limits. Do not confuse with ideal (optimum) values, which are $22.2^{\circ}$ to $25.6^{\circ} \mathrm{C}$ and $40 \%$ to $50 \%$ relative humidity.
2. The 4969 operating temperature is $15.6^{\circ}$ to $32.2^{\circ} \mathrm{C}$, independent of magnetic tape type used. Because of a $2.8^{\circ} \mathrm{C}$ (max) temperature difference between ambient inlet air and the tape chamber, the 4969 should not operate at ambient temperatures greater than $29.4^{\circ} \mathrm{C}$ when using tapes as specified in Tape Specifications for the IBM One-Half Inch Tape Drives at 556, 800, 1600 , and 6250 BPI, GA32-0006.

Notes...

1. Also need rack adapter weighing 8 kg .
2. Add 0.1 kVA to the power load of the attached processor.
3. Includes a controller weighing 6 kg (feature \# 1540, 1545, or 1550).
4. Add 7 kg for units with stand-alone enclosure.

Notes...

1. Also need rack adapter weighing 17 lb .
2. Add 0.1 kV t to the power load of the processor.
3. Includes a controller weighing 13 lb (feature \# 1540, 1545, or 1550 ).
4. Add 15 lb for units with stand-alone enclosure.

## Environmental linitits for <br> Series/1 shipment antd storage

The following criteria applies to all Series/ 1 machines except as noted.

These limits do not apply to supplies (tape, diskettes, cards, paper forms, ribbons, and so on). See individual supply specifications as required.

## Shipment

Air temperature
$\quad$ (except 4978, 4979, and 4980)

Air temperature
4978,4979 , and 4980
Relative humidity

Wet bulb temperature

Vibration

Shock
-40 to $+60^{\circ} \mathrm{C}$
$\left(-40\right.$ to $\left.+140^{\circ} \mathrm{F}\right)$

20 to $+60^{\circ} \mathrm{C}$
$\left(-4\right.$ to $\left.+140^{\circ} \mathrm{F}\right)$
5 to 100\% excluding rain
0.6 to $29.4^{\circ} \mathrm{C}$ (33 to $85^{\circ} \mathrm{F}$ )

See Chapter 9
See Chapter 9

## Notes:

1. The upper limit of air temperature is derated $0.6^{\circ} \mathrm{C}\left(1^{\circ} \mathrm{F}\right)$ per $75 \mathrm{~m}(250 \mathrm{ft})$ of elevation above $914 \mathrm{~m}(3000 \mathrm{ft})$.
2. The upper limit of wet bulb temperature is derated $0.6^{\circ} \mathrm{C}$ $\left(1^{\circ} \mathrm{F}\right)$ per $152 \mathrm{~m}(500 \mathrm{ft})$ of

Storage
0.6 to $60^{\circ} \mathrm{C}$ (33 to $140^{\circ} \mathrm{F}$ )
0.6 to $60^{\circ} \mathrm{C}$ (33 to $140^{\circ} \mathrm{F}$ )

5 to $80 \%$
0.6 to
$29.4^{\circ} \mathrm{C}$
elevation above 305 m (1000 ft).
3. Thermal shock and thermal rate of change should be kept to a minimum during all shipment and storage of Series/1 machines.

## Environment

Air must flow freely through the IBM 4952 unit. The hardware fan blower assembly produces forced-air cooling.

The temperature and relative humidity listed on pages 5-3 and 5-6 are upper and lower limits; they are not optimum operating points.

## Vibration limits

It is your responsibility to ensure that the vibration does not exceed the specified levels. The IBM 4952 is designed to operate within the following limits. See the vibration and shock level graphs in Chapter 9 for additional information.

| $5-13 \mathrm{~Hz}$ continuous transient | $\begin{aligned} & =0.762 \mathrm{~mm}(0.030 \mathrm{in} .) \\ & \text { double amplitude } \\ & =1.016 \mathrm{~mm}(0.040 \mathrm{in} .) \\ & \text { double amplitude } \end{aligned}$ |

## Environment

Air must flow freely through the IBM 4956 unit. The hardware fan blower assembly produces forced-air cooling.

The temperature and relatiye humidity listed on pages 5-3 and 5-6 are upper and lower limits; they are not optimum operating points.

## Vibration limits

It is your responsibility to ensure that the vibration does not exceed the specified levels. The IBM 4956 is designed to operate within the following limits. See the vibration and shock level graphs in Chapter 9 for additional information.

| $\mathbf{5 - 1 4} \mathrm{Hz}$ continuous transient | $\begin{aligned} & =0.762 \mathrm{~mm}(0.030 \mathrm{in} .) \\ & \text { double amplitude } \\ & =\begin{array}{l} 1.016 \mathrm{~mm}(0.040 \mathrm{in} .) \\ \text { double amplitude } \end{array} \end{aligned}$ |

## Environment

Air must flow freely through the IBM 4959 unit. The hardware fan blower assembly produces forced-air cooling.

The temperature and relative humidity listed on pages 5-3 and 5-6 are upper and lower limits; they are not optimum operating points.

## Vibration limits

It is your responsibility to ensure that the vibration does not exceed the specified levels. The IBM 4959 is designed to operate within the following limits. See the vibration and shock level graphs in Chapter 9 for additional information.

| $\mathbf{5 - 1 7 ~ H z}$ continuous transient | $\begin{aligned} &= 0.914 \mathrm{~mm}(0.036 \mathrm{in} .) \\ & \text { double amplitude } \\ &= 1.22 \mathrm{~mm}(0.048 \mathrm{in} .) \\ & \text { double amplitude } \end{aligned}$ |
| :---: | :---: |
| $\mathbf{1 7 - 2 0 0 ~ H z}$ continuous transient | $\begin{aligned} &= 0.55 \mathrm{G} \text { peak } \\ & \text { acceleration } \\ &= 0.73 \mathrm{G} \text { peak } \\ & \text { acceleration } \end{aligned}$ |
| $200-500 \mathrm{~Hz}$ continuous transient | $\begin{aligned} &= 0.25 \mathrm{G} \text { peak } \\ & \text { acceleration } \\ &= 0.33 \mathrm{G} \text { peak } \\ & \text { acceleration } \end{aligned}$ |

## Signal cables

The 4959 is connected to a Series/1 Processor by four flat cables. The cables are available in two lengths: $0.9 \mathrm{~m}(3 \mathrm{ft})$ and $1.8 \mathrm{~m}(6 \mathrm{ft})$. There are cable entry/exit slots on both the top and bottom of the processors, 4965, and I/O expansion units.

## Customer output alarm relay contact

A 4959 with the Two Channel Switch (TCS) feature has an output contact on the TCS console card to allow you to connect an external alarm.

The electrical specifications for the alarm relay contacts are:

- $\quad 12 \mathrm{Vdc}, 300 \mathrm{~mA}$ resistive
- $24 \mathrm{Vdc}, 150 \mathrm{~mA}$ resistive.

The terminator for the connector is shipped with the TCS feature (see the installation instructions shipped with the unit).

The external alarm is not included with the TCS feature.

## CAUTION

If the external alarm is electrically inductive, an appropriate arc-suppression network should be used to protect the relay contacts; otherwise, damage to the contacts can occur.

| Receptacle | NEMA 5-15R |  |

Note...
$90 \%$ of each exterior cover surface must not exceed $52^{\circ} \mathrm{C}\left(125^{\circ} \mathrm{F}\right)$.

## Environment

Air must flow freely through the IBM 4962 unit. The hardware fan blower assembly produces forced-air cooling.

The temperature and relative humidity listed on pages 5-3 and 5-6 are upper and lower limits; they are not optimum operating points.

Note: $90 \%$ of each exterior cover surface must not exceed $52^{\circ} \mathrm{C}$ $\left(125^{\circ} \mathrm{F}\right)$.

## Vibration limits

It is your responsibility to ensure that the vibration does not exceed the specified levels. The IBM 4962 is designed to operate within the following limits. See the vibration and shock level graphs in Chapter 9 for additional information.

| $\mathbf{5 - 2 4 ~ H z}$ <br> continuous | $=$$0.254 \mathrm{~mm}(0.01 \mathrm{in})$. <br> double amplitude |
| :--- | :--- |
| transient | $=$0.381 mm ( $0.015 \mathrm{in})$. <br> double amplitude |
| $\mathbf{2 4 - 1 2 0 ~ H z}$ <br> continuous | $=$0.3 G peak <br> acceleration |
| transient | $=$0.4 G peak <br> acceleration |
| $\mathbf{2 0 0 - 5 0 0 ~ H z}$ <br> continuous | $=$0.15 G peak <br> acceleration |
| transient | $=$0.23 G peak <br> acceleration |

Assume " $G$ " levels from $120-200 \mathrm{~Hz}$ to be linear.

## Service accessibility

For servicing, it is necessary to slide the IBM 4962 completely out of the rack. Because of the weight and service considerations, the unit should be mounted at the bottom of the rack. However, the 4962 unit is to be installed so that the top of the unit is no higher than $1.1 \mathrm{~m}(3.5 \mathrm{ft})$ above the floor. Adequate service areas to the right, left, and front of the extended unit must be provided. It is your responsibility to ensure that the enclosure, if it is other than an IBM 4997, will not tip when the 4962 unit is fully extended.

## Signal cables

The 4962 Disk Attachment Feature card is connected to the 4962 by four flat cables. The length of each cable is $5 \mathrm{~m}(15 \mathrm{ft})$.

## Service accessibility

For servicing, it is necessary to slide the IBM 4962 completely out of the rack. Because of the weight and service considerations, the unit should be mounted at the bottom of the rack. However, the 4962 unit is to be installed so that the top of the unit is no higher than $1.1 \mathrm{~m}(3.5 \mathrm{ft})$ above the floor. Adequate service areas to the right, left, and front of the extended unit must be provided. It is your responsibility to ensure that the enclosure, if it is other than an IBM 4997, will not tip when the 4962 unit is fully extended.

## Signal cables

The 4962 Disk Attachment Feature card is connected to the 4962 by four flat cables. The length of each cable is 4.6 m ( 15 ft ).

## 4963 Disk Storage Unit

Models 23A, 23B, 29A, 29B,
$58 \mathrm{~A}, 58 \mathrm{~B}, 64 \mathrm{~A}$, and 64B

|  | acceleration |

## Service accessibility

Adequate service areas to the right, left, and front of the extended unit must be provided. For servicing, it is necessary to slide the unit 622 mm ( 24.5 in .) out of the rack. It is your responsibility to ensure that the enclosure, if it is other than an IBM 4997, will not tip when the 4963 unit is fully extended.

## Signal cables

The 4963 Disk Attachment Feature card is connected to the IBM 4963 Disk Storage Unit by two flat cables. The length of each cable is $6.1 \mathrm{~m}(20 \mathrm{ft})$. One to three additional 4963 units can also be attached to the base 4963 unit by flat cables.

*When included, the autotransformer adds 7.3 kg $(16 \mathrm{lb})$ to the weight of the rack.
**4964 units ordered with 100 - volt or 200 - volt power options include the step-up autotransformer. However, 60 Hz units shipped after November, 1977, and 50 Hz units shipped after March, 1978, will not use an autotransformer.

## Environment

Air must flow freely through the IBM 4964 unit. The hardware fan blower assembly produces forced-air cooling.

The temperature and relative humidity listed on pages 5-3 and 5-5 are upper and lower limits; they are not optimum operating points.

## Vibration limits

It is your responsibility to ensure that the vibration does not exceed the specified levels. The IBM 4964 is designed to operate within the following limits. See the vibration and shock level graphs in Chapter 9 for additional information.

| 5-25 Hz continuous transient | $\begin{aligned} & =0.254 \mathrm{~mm}(0.010 \mathrm{in} .) \\ & \text { double amplitude } \\ & =\begin{array}{l} 0.381 \mathrm{~mm}(0.015 \mathrm{in} .) \\ \text { double amplitude } \end{array} \\ & \hline \end{aligned}$ |

| transient | $=$0.11 G peak <br> acceleration |
| $\mathbf{2 0 0 - 5 0 0 ~ H z}$  <br> continuous $=$ <br> transient $=$0.036 G peak <br> acceleration <br> 0.055 G peak <br> acceleration |  |

See the vibration and shock level graphs in Chapter 9 for additional information.

## Signal cables

To connect the 4965 Model 30D or 60D shelf-mounted unit to a shelf-mounted Series $/ 1$ processor, you need feature \#4525 Stand-Alone Enclosure Cable, a 4-in-1 external shielded cable. The cable is $3.1 \mathrm{~m}(10 \mathrm{ft})$ in length.

| Assume " $G$ " levels from $150-200 \mathrm{~Hz}$ to be linear. |  |

## Service accessibility

Adequate service areas to the right, left, and front of the extended unit must be provided. For servicing, it is necessary to slide the unit 622 mm ( 24.5 in .) out of the rack. It is your responsibility to ensure that the enclosure, if it is other than an IBM 4997, will not tip when the 4966 unit is fully extended.

## Signal cables

The 4966 Diskette Magazine Unit Feature card is connected to the 4966 by one flat cable. The length of the cable is $4.6 \mathrm{~m}(15 \mathrm{ft})$.

## Environment

Air must flow freely through the IBM 4967 unit. The hardware fan blower assembly produces forced-air cooling.

The temperature and relative humidity listed on pages 5-3 and 5-6 are upper and lower limits; they are not optimum operating points.

## Vibration limits

Make sure that the vibration does not exceed the specified levels. The IBM 4967 is designed to operate within the following limits. See the vibration and shock level graphs in Chapter 9 for additional information.

| $\mathbf{5 - 1 7 ~ H z}$ <br> continuous | $=$$0.127 \mathrm{~mm}(0.005 \mathrm{in})$. <br> double amplitude |
| :--- | :--- |
| transient | $0.206 \mathrm{~mm}(0.008 \mathrm{in})$. <br> double amplitude |
| $\mathbf{1 7 - 2 0 0 ~ H z}$ <br> continuous | $=$0.07 G peak <br> acceleration |
| transient | $=$0.11 G peak <br> acceleration |
| $\mathbf{2 0 0 - 5 0 0 ~ H z}$ <br> continuous | $=$0.035 G peak <br> acceleration |
| transient | $=$0.055 G peak <br> acceleration |

See the vibration and shock level graphs in Chapter 9 for additional information.

## Service accessibility

Provide adequate service areas to the right, left, front, and bottom of the extended unit. For service access, the unit must slide 653 mm ( 25.7 in .) out of the rack and pivot face-down to a vertical position. Allow at least 209 mm ( 8.2 in .) clearance at the bottom of the unit. If the enclosure is not an IBM 4997, make sure that the enclosure will not tip when the 4967 is fully extended.

## Signal cables

Two flat cables connect the 4967
Disk Attachment Feature Card to the IBM 4967 Disk Unit. The length of each cable is 4.6 m ( 15 ft ).

In addition, one to three 4967 units can be attached to the base 4967 unit by flat cables.

Note...
Units are designed to operate at nominal atmospheric pressure $\pm 2.6 \%$ from sea level to 2135 m (7 000 ft ).

## Environment

Air must flow freely through the IBM 4969 unit. The unit is cooled by forced-air fans; therefore, airflow must not be blocked.

The temperature and relative humidity listed on pages 5-3 and 5-6 are upper and lower limits and are not to be construed as optimum operating points. The 4969 Models $4 \mathrm{D}, 4 \mathrm{~N}$, and 4 P are designed to operate at nominal atmospheric pressure $\pm 2.6 \%$ from sea level to 2135 m (7000 ft).

## Vibration limits

It is your responsibility to ensure that the vibration does not exceed the specified levels. The IBM 4969 is designed to operate within the following limits. See the vibration and shock level graphs in Chapter 9 for additional information.

| $\mathbf{5 - 1 7 ~ H z}$ <br> continuous <br> transient | $=$$0.127 \mathrm{~mm}(0.005 \mathrm{in})$. <br> double amplitude <br> $0.207 \mathrm{~mm}(0.008 \mathrm{in})$. <br> double amplitude |
| :--- | :--- |
| $\mathbf{1 7 - 2 0 0 ~ H z}$ <br> continuous | $=$0.07 G peak <br> acceleration |
| transient | $=$0.11 G peak <br> acceleration |
| $\mathbf{2 0 0 - 5 0 0 ~ H z}$  <br> continuous  <br> transient $=$0.035 G peak <br> acceleration <br>  $=$0.055 G peak <br> acceleration |  |

## Service accessibility

For servicing, it is necessary to open the front or rear of the 4969 unit. Adequate service areas to the right, left, front, and rear of the unit must be provided. It is your responsibility to ensure that the enclosure will not tip when the 4969 unit is serviced. The mounting surface must be fixed and perpendicular to the floor. The 4969 is mounted to the front and rear vertical rails of the 4997 Model 2 Rack Enclosure using the air baffle provided with the 4969 unit. The air baffle requires a vertical mounting rail thickness of 2.3 mm ( 0.09 in.). A different rail thickness may prevent mounting the 4969. An electrical outlet is required for servicing equipment.

It is recommended that the 4969 unit be ordered factory mounted in a 4997 Model 2 Rack Enclosure. The 4969 cannot be installed in a 4997 Model 1 Enclosure. If you already have installed an IBM 4997 Model 2 Enclosure with adequate rack space 709 mm (27.9 in.) or an EIA standard enclosure, then it is
your responsibility to physically mount the 4969 unit into your preferred position. The IBM Customer Engineer will install the attachment card (Feature \#1215), connect the cables, and check out the system. If the 4969 unit is not rack mounted, the IBM Customer Engineer can still check out the unit while it is within its frame and pallet mounted. The Series $/ 1$ must be within cable length. It is your respsonsibility, in this case, to provide adequate cabling protection and shielding to ensure correct operation.

## Signal cables

The 4969 Magnetic Tape Attachment Feature card is connected to the IBM 4969 Magnetic Tape Unit by two flat cables. The length of each cable is $6.1 \mathrm{~m}(20 \mathrm{ft})$. Up to four 4969 units can be included in a subsystem attached to one attachment feature card. Each of the expansion units are connected by multiunit cables. The length of each multiunit cable is $1.8 \mathrm{~m}(6 \mathrm{ft})$.

## Environment

Air must flow freely through the IBM 4969 unit. The unit is cooled by forced-air fans with the air exiting at the top of the unit. At least 75 mm ( 3 in.) clearance must be left between the top of any Model 7D, 7 N , or 7 P unit and any equipment mounted above it.

The temperature and relative humidity listed on pages 5-3 and 5-6 are upper and lower limits and are not to be construed as optimum operating points. The 4969 Models $7 \mathrm{D}, 7 \mathrm{~N}$, and 7 P can be installed to operate from sea level to 1524 m ( 5000 ft ).

## Vibration limits

It is your responsibility to ensure that the vibration does not exceed the specified levels. The IBM 4969 is designed to operate within the following limits. See the vibration and shock level graphs in Chapter 9 for additional information.

| $5-17 \mathrm{~Hz}$ continuous transient | $\begin{aligned} & =\begin{array}{l} 0.127 \mathrm{~mm}(0.005 \mathrm{in} .) \\ \text { double amplitude } \\ = \\ 0.207 \mathrm{~mm}(0.008 \mathrm{in} .) \\ \text { double amplitude } \end{array} \end{aligned}$ |
| :---: | :---: |
| 17-200 Hz continuous transient | $\begin{aligned} & =0.07 \mathrm{G} \text { peak } \\ & \text { acceleration } \\ & =\begin{array}{l} 0.11 \mathrm{G} \text { peak } \\ \text { acceleration } \end{array} \end{aligned}$ |
| 200-500 Hz continuous <br> transient | $\begin{aligned} & =0.035 \mathrm{G} \text { peak } \\ & =0 \begin{array}{l} \text { acceleration } \\ \\ \text { acceleration } \end{array} \end{aligned}$ |

## Service accessibility

For servicing, it is necessary to open the front or rear of the 4969 unit. Adequate service areas to the right, left, front, and rear of the unit must be provided. It is your responsibility to ensure that the enclosure will not tip when the 4969 unit is serviced. The mounting surface must be fixed and perpendicular to the floor. The 4969 is mounted to the front and rear vertical rails of the 4997 Model 2 Rack Enclosure using the air baffle provided with the 4969 unit. The air baffle requires a vertical mounting rail thickness of 2.3 mm (0.09 in.). A different rail thickness may prevent mounting the 4969. An electrical outlet is required for servicing equipment.

It is recommended that the 4969 unit be ordered factory mounted in a 4997 Model 2 Rack Enclosure. The 4969 cannot be installed in a 4997 Model 1 Enclosure. If you already have installed an IBM 4997 Model 2 Enclosure with adequate rack space 709 mm ( 27.9 in .) or an EIA standard enclosure, then it is
your responsibility to physically mount the 4969 unit into your preferred position. The IBM Customer Engineer will install the attachment card (Feature \#1215), connect the cables, and check out the system. If the 4969 unit is not rack mounted, the IBM Customer Engineer can still check out the unit while it is within its frame and pallet mounted. The Series/ 1 must be within cable length. It is your respsonsibility, in this case, to provide adequate cabling protection and shielding to ensure correct operation.

## Signal cables

The 4969 Magnetic Tape Attachment Feature card is connected to the IBM 4969 Magnetic Tape Unit by two flat cables. The length of each cable is 6.1 m ( 20 ft ). Up to four 4969 units can be included in a subsystem attached to one attachment feature card. Each of the expansion units are connected by multiunit cables. The length of each multiunit cable is $1.8 \mathrm{~m}(6 \mathrm{ft})$.

| Size | 16 AWG |

Power Cord Plugs and Receptacles
(U.S./Canada only)**

Volts 115
Plug (molded cord set)
Receptacle

*Only 60 Hz 115 Vac available for U.S. and Canada.
**Power cord plugs will be provided and installed on 4973 printers shipped within the U.S. and Canada only. Users receiving 4973 printers in other countries will be required to provide a plug and receptacle with characteristics to comply with local electrical requirements.

## Environment

Adequate space must be left around the 4973 printer to allow necessary cooling airflow to the device.

The temperature and relative humidity listed on pages 5-3 and 5-6 are upper and lower limits and are not to be construed as optimum operating points.

## Vibration limits

It is your responsibility to ensure that the vibration does not exceed the specified levels. The IBM 4973 is designed to operate within the following limits. See the vibration and shock level graphs in Chapter 9 for additional information.

| 5-17 Hz continuous transient | $\begin{aligned} &= 0.128 \mathrm{~mm}(0.005 \mathrm{in} .) \\ & \text { double amplitude } \\ &= 0.204 \mathrm{~mm}(0.008 \mathrm{in} .) \\ & \text { double amplitude } \end{aligned}$ |
| :---: | :---: |
| 17-200 Hz continuous <br> transient | $\begin{aligned} & =0.044 \mathrm{G} \text { peak } \\ & =0.055 \mathrm{G} \text { G peak } \\ & =0.05 \mathrm{acceleration} \end{aligned}$ |
| $200-500 \mathrm{~Hz}$ continuous transient | $\begin{aligned} & =0.023 \mathrm{G} \text { peak } \\ & =0 \begin{array}{l} \text { acceleration } \\ =0.038 \mathrm{G} \mathrm{peak} \\ \text { acceleration } \end{array} \end{aligned}$ |
| Assume "G" level from $150-200 \mathrm{~Hz}$ to be linear. |  |

## Signal cables

The 4973 Printer Attachment Feature card is connected to the IBM 4973 printer by one signal cable. Signal cables are available in lengths of 6.1 to 46.4 m ( 20 to 150 $\mathrm{ft})$ in $3.1 \mathrm{~m}(10 \mathrm{ft})$ increments. This cable is not supported for outdoor installation.

## Environment

Air must flow freely through the IBM 4978 unit.

The temperature and relative humidity listed on pages 5-3 and 5-6 are upper and lower limits and are not to be construed as optimum operating points.

## Vibration limits

It is your responsibility to ensure that the vibration does not exceed the specified levels. The IBM 4978 is designed to operate within the following limits. See the vibration and shock level graphs in Chapter 9 for additional information.

| $\mathbf{5 - 1 7} \mathrm{Hz}$ continuous transient | $\begin{aligned} & =0.127 \mathrm{~mm}(0.005 \mathrm{in} .) \\ & =\begin{array}{l} \text { double amplitude } \\ 0.203 \mathrm{~mm}(0.008 \mathrm{in} .) \\ \text { double amplitude } \end{array} \end{aligned}$ |
| :---: | :---: |
| $17-150 \mathrm{~Hz}$ continuous <br> transient | $\begin{aligned} &= 0.07 \mathrm{G} \text { peak } \\ & \text { acceleration } \\ &= 0.11 \mathrm{G} \text { peak } \\ & \text { acceleration } \end{aligned}$ |
| $200-500 \mathrm{~Hz}$ <br> continuous <br> transient | $\begin{aligned} = & 0.035 \mathrm{G} \text { peak } \\ & \text { acceleration } \\ = & 0.055 \mathrm{G} \text { peak } \\ & \text { acceleration } \end{aligned}$ |
| Assume "G" level from $150-200 \mathrm{~Hz}$ to be linear. |  |

## Signal cables

The 4978 Display Attachment Feature card is connected to the IBM 4978 Display Station by one signal cable. This signal cable is available with the 4978 in lengths of 6 to 150 m ( 20 to 500 ft ). The minimum length available when ordered separately is 9 m ( 30 ft ). The signal cable has a bend radius of 67 mm ( 2.6 in. ), and OD of 14 mm ( 0.56 in .) and a weight of .335 $\mathrm{Kg} / \mathrm{m}(3.6 \mathrm{oz} / \mathrm{ft})$. The usable length of the cable attaching the keyboard to the display is 0.7 m ( 28 in.) except for RPQ DO2064 which includes a cable with a usable length of 1.7 m ( 67 in .).

This cable is not supported for outdoor installation.

| Receptacle | NEMA 5-15R | set) |

*A minimum clearance of 51 mm ( 2 in ) must be provided above the unit to allow warm air exhaust.
**Power cord plugs will be provided and installed on 4979 displays shipped within the U.S. and Canada only. Users receiving 4979 displays in other countries will be required to provide a plug and receptacle with characteristics to comply with local electrical requirements.

## Environment

Adequate space must be left around the 4979 Display Station to allow necessary cooling airflow to the device. A minimum clearance of 51 mm ( 2 in.) must be provided above the unit to allow warm air exhaust.

The temperature and relative humidity listed on pages 5-3 and 5-6 are upper and lower limits and are not to be construed as optimum operating points.

## Vibration limits

It is your responsibility to ensure that the vibration does not exceed the specified levels. The IBM 4979 is designed to operate within the following limits. See the vibration and shock level graphs in Chapter 9 for additional information.

| 5-17 Hz <br> continuous <br> transient | $\begin{aligned} &= 0.127 \mathrm{~mm}(0.005 \mathrm{in} .) \\ & \text { double amplitude } \\ &= 0.203 \mathrm{~mm}(0.008 \mathrm{in} .) \\ & \text { double amplitude } \end{aligned}$ |

## Environment

Air must flow freely through the IBM 4987 unit. The hardware fan blower assembly produces forced-air cooling.

The temperature and relative humidity listed on pages 5-3 and 5-6 are upper and lower limits and are not to be construed as optimum operating points.

## Vibration limits

It is your responsibility to ensure that the vibration does not exceed the specified levels. The IBM 4987 is designed to operate within the following limits. See the vibration and shock level graphs in Chapter 9 for additional information.

## Signal cables

The 4987 Programmable Communications Subsystem Attachment Feature cards are connected to the 4987 enclosure by two flat cables. Each cable is $6.1 \mathrm{~m}(20 \mathrm{ft})$ long. The IBM-supplied cables that connect the 4987 communication feature cards to the data communications equipment/data terminal equipment are $6.1 \mathrm{~m}(20 \mathrm{ft})$ long. The cable that connects the 4990 Communications Console to the 4987 enclosure is 2.0 m ( 6.5 ft ) long.

## Environment

Air must flow freely through the IBM 4993 unit. The unit is cooled by convection; therefore, airflow must not be blocked.

The temperature and relative humidity listed on pages 5-3 and 5-6 are upper and lower limits and are not to be construed as optimum operating points.

## Vibration linnits

It is your responsibility to ensure that the vibration does not exceed the specified levels. The IBM 4993 is designed to operate within the following limits. See the vibration and shock level graphs in Chapter 9 for additional information.

| $\mathbf{5 - 1 7 \mathrm { Hz }}$continuous $=$$0.914 \mathrm{~mm}(0.036 \mathrm{in})$. <br> double amplitude <br> transient $=$1.22 mm (0.048 in.) <br> double amplitude <br> $\mathbf{1 7 - 2 0 0 ~ H z}$  <br> continuous $=$0.55 G peak <br> acceleration <br> transient $=$0.73 G peak <br> acceleration <br> $\mathbf{2 0 0 - 5 0 0 ~ H z}$ <br> continuous $=$0.25 G peak <br> acceleration <br> transient $=$0.33 G peak <br> acceleration |
| :--- | :--- |

## Signal cables

The IBM 4993 Attachment Feature card is connected to the IBM 4993 Series/1-System/370 Termination Enclosure by cable. The length of the cable is $2.4 \mathrm{~m}(7.8 \mathrm{ft})$.

## Systein/370 cables

System/370 channel cables are not provided with the Series/1 4993 Termination Enclosure. These cables (cable group number 1806) should be ordered ${ }^{1}$ by your IBM marketing representative when System/370 installation planning for the Series/1 is performed. The channel cables connect a Series/1 4993 to a System/370 (Models 135-168) or to an IBM 3031, 3032, 3033,4331 , or 4341 processor, or to a control unit.
Cable group number ... 1806
Number of cables ... 2

## Maximum cable length

Total cable length of 200 feet (unless modified by general control-to-channel cabling schematic) on which up to eight control units may be attached.

[^2]
## 4997 Rack Enclosure Models

Plan view (Not drawn to scale)

| Dimensions |  |  |  |
| :--- | :--- | :--- | :--- |
|  | Width | Depth | Height |
|  | 610 | 749 | 1000 |
| Millimeters | $(24)$ | $(29-1 / 2)$ | $(39-1 / 2)$ |

Service Clearance

Maximum Weight**
$57 \mathrm{~kg} \quad(125 \mathrm{lb})$

## Power Requirements

Power requirements must be calculated using the Product Specification worksheet. The 4997 enclosure is limited to 16 amperes ( 15 amperes in Canada).
Branch circuit 20 A
Power Cord

| Length | $4.3 \mathrm{~m}(14 \mathrm{ft})$ |
| :--- | :--- |
| Conductors | 3 |
| Size | 14 AWG |

Power Cord Plugs and Receptacles***

| Volts | 115 | 208/230 |
| :--- | :--- | :--- |
| Plug | NEMA L5-20P | NEMA L6-20P |
| Receptacle | NEMA L5-20R | NEMA L6-20R |

*For each additional bay of IBM 4997-1 A or 4997-1 B enclosure bolted to the first bay increase the overall width of the enclosure by 599.9 mm ( 23.6 in ).
**An additional $7.3 \mathrm{~kg}(16 \mathrm{lb})$ must be added if the autotransformer feature is installed.
***Power cord plugs will be provided and installed on 4997 enclosures shipped within the U.S. and Canada only. Users receiving 4997 enclosures in other countries will be required to provide a plug and mating receptacle with characteristics to comply with local electrical requirements.

## Environment

Air must flow freely through the IBM 4997 unit. The temperature and relative humidity listed on pages 5-3 and 5-5 are upper and lower limits and are not to be construed as optimum operating points.

## Vibration limits

It is your responsibility to ensure that the vibration input to a 4997 enclosure does not exceed the specified levels. See the vibration and shock level graphs in Chapter 9 for additional information on systems installed in 4997 enclosures.

## Rack-mounting fixture

A rack-mounting fixture is used when half-width, 216 mm ( 8.5 in .), units are mounted in the rack enclosure. The mounting fixture mounts as a full-width, 483 mm ( 19 in .), unit with the half-width units mounted inside the fixture.

## Customer access panel

A customer access panel mounts in the rear of the rack enclosure. This panel provides connectors for the digital input/output feature, timer feature, customer direct program control feature, and the teletypewriter feature. See Chapter 8 for additional information.

## Primary power limits

The sum of Underwriter's Laboratory label rated primary power consumption in kVA for each IBM machine type installed in a 4997 Enclosure for U.S. installation may not exceed 1.80 kVA at the lower voltages (100-127.5 Vac) and 3.60 kVA at the higher voltages (200-250 Vac).

For Canadian installations, the 4997 models 1A and 1B are limited to 1.70 kVA at the lower voltages and 3.40 kVA at the higher voltages. This limit is due to the installation of a 15 amp fuse in the enclosure primary distirubiton panel.

For GBG/I installations, all enclosures are limited to 1.60 kVA at the lower voltages and 3.20 kVA at the higher voltages. These limits are independent of line frequency. The GBG/I primary power limits are somewhat tighter than the U.S. limits due to the wider range of voltages and variation of voltages to be found in worldwide installations.

## Connecting cables

When estimating the cable length required to connect from an IBM feature in a processor, 4965 , or I/O expansion unit machine type installed in a 4997 Enclosure to any external device allow $2-2.5 \mathrm{~m}$ ( $6-8 \mathrm{ft}$ ) for a $4997-2$ and $1.5-2.0 \mathrm{~m}$ ( $4-6 \mathrm{ft}$ ) for a 4997-1 for cable routing through the enclosure.

## Environment

Air must flow freely through the IBM 4997 unit. The temperature and relative humidity listed on pages 5-3 and 5-6 are upper and lower limits and are not to be construed as optimum operating points.

## Vibration limits

It is your responsibility to ensure that the vibration input to a 4997 enclosure does not exceed the specified levels. See the vibration and shock level graphs in Chapter 9 for additional information on systems installed in 4997 enclosures.

## Rack-mounting fixture

A rack-mounting fixture is used when half-width, 216 mm ( 8.5 in .), units are mounted in the rack enclosure. The mounting fixture mounts as a full-width, 483 mm ( 19 in .), unit with the half-width units mounted inside the fixture.

## Customer access panel

A customer access panel mounts in the rear of the rack enclosure. This panel provides connectors for the digital input/output feature, timer feature, customer direct program control feature, and the teletypewriter feature. See Chapter 8 for additional information.

## Primary powor limits

The sum of Underwriter's Laboratory label rated primary power consumption in kVA for each IBM machine type installed in a 4997 Enclosure for U.S. installation may not exceed 1.80 kVA at the lower voltages ( $100-127.5 \mathrm{Vac}$ ) and 3.60 kVA at the higher voltages (200-250 Vac).

For Canadian installations, the 4997 models 2A and 2B have the same rating as for U.S. applications.

For GBG/I installations, all enclosures are limited to 1.60 kVA at the lower voltages and 3.20 kVA at the higher voltages. These limits are independent of line frequency. The GBG/I primary power limits are somewhat tighter than the U.S. limits due to the wider range of voltages and variation of voltages to be found in worldwide installations.

## Connecting cables

When estimating the cable length required to connect from an IBM feature in a processor, 4965 , or I/O expansion unit machine type installed in a 4997 Enclosure to any external device allow $2-2.5 \mathrm{~m}$ ( $6-8 \mathrm{ft}$ ) for a 4997-2 and $1.5-2.0 \mathrm{~m}$ ( $4-6 \mathrm{ft}$ ) for a 4997-1 for cable routing through the enclosure.

| $\mathbf{2 0 0 - 5 0 0 ~ H z}$  <br> continuous  <br> transient $=$0.25 G peak <br> acceleration <br>  $=$0.33 G peak <br> acceleration |  |

## Output limits

The 4999 will support a fully populated 4953 or 4955 Model A, B, C, or D, or a 4952 Model B, or 4955 Models $E$ and $F$ if the ac power consumption (measured at the primary power input), corrected for power factor, does not exceed 800 VA (530 watts square wave). The 4999 does not support a 4952 Model A prior to serial number 50,000 or a 4952 Model C.

## Battery requirements

It is your responsibility to supply a battery to operate with the IBM 4999 Battery Backup Unit. The recommended battery is a sealed 12 -volt automotive type with at least a 100 ampere-hour rating.

## Battery charger requirements

It is your responsibility to supply an adequate battery charger.
Normally, being able to recharge the battery in 30 hours is sufficient. But abnormally frequent commercial power interruptions might require you to have a charger that can recharge the battery quicker. The charger should have a three-conductor line cord that is UL listed.

## Environment

Air must flow freely through the IBM 5219 unit.

The temperature and relative humidity listed on pages 5-3 and 5-6 are upper and lower limits; they are not optimum operating points.

## Vibration limits

Make sure that the vibration does not exceed the specified levels. The 5219 is designed to operate within the following limits. See the vibration and shock level graphs in Chapter 9 for additional information.

| $5-17 \mathrm{~Hz}$ continuous transient | $\begin{aligned} & =0.128 \mathrm{~mm}(0.005 \mathrm{in} .) \\ & \text { double amplitude } \\ & =\begin{array}{l} 0.204 \mathrm{~mm}(0.008 \mathrm{in} .) \\ \text { double amplitude } \end{array} \end{aligned}$ |
| :---: | :---: |
| $17-200 \mathrm{~Hz}$ continuous <br> transient | $\begin{aligned} & =0.07 \mathrm{G} \text { peak } \\ & \text { acceleration } \\ & =\begin{array}{l} 0.11 \mathrm{G} \text { peak } \\ \text { acceleration } \end{array} \end{aligned}$ |
| $200-500 \mathrm{~Hz}$ continuous transient | $\begin{aligned} & =0.036 \mathrm{G} \text { peak } \\ & \text { acceleration } \\ & =0.055 \mathrm{G} \text { peak } \\ & \text { acceleration } \end{aligned}$ |

Assume " $G$ " level from $150-200 \mathrm{~Hz}$ to be linear.

## Signal cable

One signal cable connects the 5219 to the Series/1. For information on connecting this cable, see "Printer Attachment-5200 Series" in Chapter 7.

## Notes...

1. A 180 mm ( 7 inch ) paper clearance entry is allowed at the front of the printer.
2. See world trade plug requirements in Chapter 9 .

## Environment

Air must flow freely through the IBM 5224 unit. The unit is cooled by forced-air fans; therefore, airflow must not be blocked.

The temperature and relative humidity listed on pages 5-3 and 5-6 are upper and lower limits and are not to be construed as optimum operating points.

## Vibration limits

Make sure that the vibration does not exceed the specified levels. The IBM 5224 is designed to operate within the following limits.

5225 Printer Models 1, 2, 3, and 4

Plan View (Not drawn to scale)

| Millimeters | Inches |
| :---: | :---: |
| 1110 | $43-3 / 4$ |

## Environment

Air must flow freely through the IBM 5225 unit. The unit is cooled by forced-air fans; therefore, airflow must not be blocked.

The temperature and relative humidity listed on pages 5-3 and 5-6 are upper and lower limits and are not to be construed as optimum operating points.

## Vibration limits

Make sure that the vibration does not exceed the specified levels. The IBM 5225 is designed to operate within the following limits.

## 5262 Printer Model 1

Plan view (Not drawn to scale)

## *Notes...

1. Signal cable connector location.
2. Power cable location.

Both cables can be routed through a single 64 mm (2-1/2 in) hole in raised floor. Recommended location for the hole is centered between the front and back of the machine, and 100 mm ( 4 in ) in from the right side.

## Environment

Air must flow freely through the IBM 5262 unit. The unit is cooled by forced-air fans; therefore, airflow must not be blocked.

The temperature and relative humidity listed on pages 5-3 and 5-6 are upper and lower limits and are not to be construed as optimum operating points.

## Vibration limits

Make sure that the vibration does not exceed the specified levels. The IBM 5262 is designed to operate within the following limits.

| $\mathbf{5 - 1 7 ~ H z}$ <br> continuous | $=$$0.050 \mathrm{~mm}(0.002 \mathrm{in})$. <br> double amplitude |
| :--- | :--- |
| transient | $=$$0.075 \mathrm{~mm}(0.003 \mathrm{in})$. <br> double amplitude |
| $\mathbf{1 7 - 1 5 0 ~ H z}$ | $=$0.036 G peak <br> acceleration |
| continuous | $=$0.055 G peak <br> acceleration |

See the vibration and shock level graphs in Chapter 9 for additional information.

## Chapter 6. Data communications

## Basic information

Computers and terminals communicate with each other through the use of code. Series/ 1 communication features handle various standard computer data codes such as ASCII and EBCDIC. ${ }^{2}$

Communication features are designed to handle installations when the computer and terminal devices are far enough apart (remote) to require special communication or telephone lines. In some installations, however, communication features and lines can be used even though the distance is short. Figure 6-1 shows basic communication connections.

For computers and terminals to communicate with each other, they must speak the same language. This means that these devices must use the same code, have the same type of communication features, and operate at the same speed. Speed is referred to in bits-per-second (bps).

In addition to code, feature type, and speed, the distance between computers is also an important factor in data communications. For example, people talking to each other dont need a microphone, an intercom, or a telephone. As the distance between people gets greater, however, such devices become necessary.

[^3]Figure 6-1. Communication between two or more locations any distance apart

[^4]Computer devices located close to each other usually do not use special communication features. The 4979 Display Station, for example, connects to Series/1 with its own attachment circuit card and cable rather than with a communication feature.

## Modems

The distance between the computer and peripheral devices also affects the quality of the electrical signals that carry the code. The longer the line, the weaker the signal, due to the impedance of the line. For this reason, remote computer communication usually requires modems (see Figure 6-2).

The signals produced by a terminal or computer are very weak and generally not in the form used by communication lines. A modem amplifies the signals and puts them in a form that communication lines can handle.

At the receiving end of the communication line, another modem changes the signals back to the form used by the computer or terminal.

While modems are needed with most Series/ 1 communication features, you can directly connect two devices without a modem (see Figure 6-2). This type of connection is made with the optional local attachment features.

A modem-sometimes called a data set-is a device that connects a terminal or computer to communication lines.

Figure 6-2. Modem and direct connections

## Communication lines

A communication line is a set of wires used to transfer information from one location to another. A two-wire line used to transfer information in one direction and then in the opposite direction is called a half-duplex line. Changing direction, or turnaround, takes time.

To reduce turnaround time, a four-wire, or full-duplex, line is sometimes used. With a full-duplex line, one pair of wires is used to send information, and the other pair is used to receive information. In full-duplex mode, therefore, information can be transferred in both directions at the same time.

Some communication features are designed to operate in half-duplex mode, but can be connected to a full-duplex (four-wire) line to reduce turnaround time. When connected to a four-wire line, however, these communication features cannot transfer information in both directions at the same time.

But the four-wire line does reduce turnaround because one pair of wires is always available for transferring information in either direction.

Communication lines can be either switched or nonswitched. Switching is done by dialing. Nonswitched lines can be privately owned or leased from a communications company (also called a common carrier). Switched lines are generally provided by a communications company. Equivalent lines and modems, however, can be supplied by the customer.

## Networks

Communications lines, modems, and other equipment can be arranged in several ways, depending upon the intended use. The different arrangements of this equipment are called data links or networks. The basic types of networks are as follows:

- Point-to-point, nonswitched
- Point-to-point, switched
- Multipoint, nonswitched.

Figures 6-3, 6-4, and 6-5 explain these basic networks.

Figure 6-3. Sample communication network (point-to-point, nonswitched)

Figure 6-4. Sample communication network (point-to-point), switched)

Multipoint network, nonswitched...

- Series/1 connected to several remote devices in the network
- Nonswitched, permanent connection
- Series $/ 1$ calls (polls) remote devices by their number (address)
- Only the called device answers
- The other devices wait their turn for a call

Figure 6-5. Sample communication network (multipoint, nonswitched)

## Communication planning and installation

With a basic understanding of data communication and Series/1 communication features, you are ready to plan and arrange for communication equipment and wiring.

The main tasks to be done are:

- Getting an exact list of the Series/ 1 communication features your company ordered.
- Obtaining or preparing network diagrams.
- Preparing a communication-features planning worksheet.
- Meeting with the IBM Marketing Representative or someone in your company responsible for your communication network.
- Meeting with the local communications-company representative to order needed equipment and wiring.
- Coordinating installation activity with remote locations.

## What's coming

In Chapter 2, you filled out a product-specification worksheet for the Series/ 1 machines on order. You must do a similar job for the communication features on order.

First, make copies of the communication-features summary worksheet (Figure 6-7).

Next, find out the specific communication features on order from your company's copy of the Series/1 purchase agreement.

Then, check the types and enter the quantities of feature cards and cables on the commu-nication-features summary worksheet.

This worksheet will be your record of communication features for use in your planning and coordinating tasks.

## How to prepare for it

## Preparing Network Diagrams

Once you know what communication equipment is coming, the next step is to determine how to arrange the equipment at your site and any remote locations. Talk to the person in your company who is responsible for coordinating computer communication networks. He or she may also be able to give you network diagrams for the Series/1 communication equipment. If not, you should prepare your own network diagrams (see Figures 6-3, 6-4, and 6-5).

Make copies of the communi-cation-features planning worksheet (Figure 6-34). Use a separate worksheet for each communication feature. On the worksheet, connect the device and modem blocks with lines to indicate the network arrangement for the feature. Indicate whether the network is switched or nonswitched (see Figure 6-3, 6-4, and 6-5).

The network-diagram part of the worksheet is for typical networks. You may have to use additional worksheets or separate sheets of paper to draw your network if the worksheet space is not adequate.

Specifying Communication Equipment and Wiring

Check or fill in as much of the remaining part of the communi-cation-features planning worksheet as you can. See Figures 6-8 through 6-33 for the information needed for your features. You may not be able to answer some items, such as the modem model, until you meet with your local communications-company representative.

Meeting with the
Communications-Company Representative

With your planning worksheets prepared, you are ready to contact your communications company (refer to the "Sample Site-Preparation schedule" in Chapter 1 for recommended timing). The purposes of such a meeting are to:

- Define the equipment and wiring to be provided by the communications company.
- Determine the power outlets needed for communications-company equipment.
- Place an order for the needed services.
- Schedule the installation work that the communications company will do before your Series/1 arrives.

## Coordinating the Installation with Remote Locations

Some of the devices communicating with your Series/1 might be located at remote sites (other buildings or cities). You will probably have to coordinate the Series/ 1 installation with these remote locations to be sure that the proper equipment is installed on time.

It is very important that the remote equipment match the equipment at your local site-as explained at the beginning of this chapter. Remember:

- Communicating devices must use the same type of communication features.
- The devices must operate at the same speed (bits-per-second).
- The modems must be of the same type.
- Modem strapping (jumpers) must be the same at both ends of the line.

Problems can occur during the installation of communication equipment as a result of mismatched equipment at the communicating locations. You can prevent such problems by proper coordination with remote sites.

We recommend that you send a copy of your completed communication-features planning worksheet to any remote locations. Also, you should follow-up with the installation activities at remote locations.

Wiring practices for Privately Owned Lines when Using Modems

If you are planning to install your own communication lines for a point-to-point, nonswitched network, you should keep the following recommendations in mind:

- All communication lines entering a Series $/ 1$ system should have the cable body shield grounded to the frame at the point of entrance to the system. To do this, remove a short section of the outer cable jacket and, use a grounding cable clamp, clamping the cable to the 4997 enclosure frame. This technique provides a positive ground and support for the cable.
- Do not route your communication lines parallel with power lines. Power transients can cause electrical noise in your communication lines. Noise can also be caused by electric motors, radios, and radar equipment.
- Where communication lines exit a building, use shielded, outdoor-type cable.
- Install shunt-type lightning protection on all exterior communication lines, whether they are buried or overhead lines.
- Ground the shields of overhead communication lines where cables enter or exit junction boxes or other points where the shield is broken. For buried lines, ground the shield at each building exit or entry. Shield continuity must not be broken where the ground wire connects to the shield. Cable that includes a drain wire is easier to install where multiple grounding is needed.
- Refer to applicable national and local safety standards for communication requirements. (For installations in the U.S., see Chapter 9 in this manual.)

## Communication Feature

A variety of communication features are available for connecting Series/ 1 to terminals or other computers by communication (telephone) lines. A terminal is a device, such as a display station, used to communicate with a . computer.

Communication features are optional Series/ 1 circuit cards and cables used for different types of communication connections.

The two basic types of Series/ 1 communication features are:

- Integrated communication features (circuit cards located in the Series/1 processor, 4965 , or I/O expansion unit)
- Programmable communication features (circuit cards located in the 4987 Programmable Communications Subsystem).

Figure 6-1 gives an overview of the communication features.

Someone in your company has already selected the specific features to be used at your site. The purpose of this chapter is to help you plan and arrange for the proper communication equipment and wiring for those communication features. You need not be an expert on computer communications. However, some basic information will be helpful.

For planning purposes, a communications feature worksheet is at the end of this chapter.

## Cables and connectors

The following table shows the materials, cables, and connectors used in building the various communications and attachment cables.

Card and connector tab!e

## Communication features

## Programmable

Communications-feature circuit cards located in 4987 Programmable Communications Subsystem...

- Data communications equipmen't (DCE) attachment features
- Single-line and two-line feature;
- Asynchronous or synchronous
- Local attachment features
- Two-line asynchronous or synchronous features
- Direct connection to local devices
- Auto-call attachment feature
- Auto-call and single-line DCE attachment
-- Asynchronous or synchronous
- Teletypewriter attachment feature
- Two four-wire de lines
- Dataphone Digital Service attachment feature
- Single-line synchronous feature
- Integrated-modem attachment features
- Connection to switched or leased lines
- Auto-answer or manual answer for switched lines
- Asynchronous or synchronous

2]

## Integrated

Communications-feature circuit cards located in processor or I/O expansion unit...

- Asynchronous communication control (ACC)
- Single-line adapter
- Four-line adapter
- Multi-line controller for eight start-stop lines using up to two four-line adapters
- Binary synchronous communications (BSC)
- Single-line adapter, medium speed
- Single-line adapter, high speed
-- Four-line adapter
- Multi-line controller for up to eight BSC. lines using up to two four-line adapters
- Synchronous data link control (SDLC)
- Single-line adapter
- Programmable multi-line communication (synchronous or asynchronous)
- Programmable four-line adapter
-- Programmable eight-line control for eight lines using up to two four-line adapters.
- Synchronous communication
- Single-line control, high speed

Figure 6-6. Series/ 1 communication features

## Series/ 1 communication features

## Features summary

Series/ 1 communication feature cards and cables are summarized in Figure 6-7. This figure is also referred to later in the chapter when you inventory your specific communication features.

## Cable features and connecting options

Special cable features are available for connecting Series/1 integrated communication features (Figure 6-7, part 1) to local devices or communication lines. The various cable features and connecting options are described in detail in Figures 6-8 through 6-18.

Cables for connecting Series/1 programmable communication features (Figure 6-7, part 2) to local devices or communication lines are included with the communication features selected. The various cables and connecting options are described in detail in Figures 6-19 through 6-32.

All communication features come with connectors or terminals for connections to devices, modems, or other communication equipment. When estimating the cable length required to connect an IBM feature installed in a Series/1 Enclosure to any external device, allow 2-2.5 m (6-8 ft) for a $4997-2,1.5-2.0 \mathrm{~m}$ (4-6 ft) for a 4997-1, and 1.5 m (4 ft) for 4952-C with stand-alone enclosure for cable routing through the enclosure provided.

Some devices connected to Series/ 1 communication features use local attachment cables. These cables connect directly to similar cables from the local devices.

Cable and signal connections for Series/ 1 communication features conform to industry standards as indicated in Figures $6-8$ through 6-28. The standards referred to are as follows:

- Electronic Industries Association (EIA)
- Consultive Committee on International Telephone and Telegraph (CCITT).

## Current loop cable length

Practical lengths for current loop cables as a part of the communication bit rate are shown in the following table. These distances
are conservative and should be satisfactory for most installations. The best transmission is achieved when the terminal and host each power their own transmission lines. While unshielded lines yield greater distances, they are more susceptible to errors in an electrically noisy environment.

|  | Shielded <br> wire | Unshielded <br> wire |
| :--- | :--- | :--- |
| rate | $m(f t)$ | $m(f t)$ |
| 110 | $1524(5000)$ | $1830(6000)$ |
| 150 | $1524(5000)$ | $1830(6000)$ |
| 300 | $1524(5000)$ | $1830(6000)$ |
| 600 | $1524(5000)$ | $1830(6000)$ |
| 1200 | $1220(4000)$ | $1830(6000)$ |
| 2400 | $610(2000)$ | $910(3000)$ |
| 4800 | $305(1000)$ | $610(2000)$ |
| 9600 | $152(500)$ | $305(1000)$ |

Note: Current loop cables are not supported for outdoor installation.

## ACC features..

- Asynchronous communication control features available in single or multiple lines (up to eight lines).
- Single-line ACC is one feature circuit card.
- Multiple-line ACC is two or three feature cards (one control card and one or two adapter cards)
- Two cards for one to four lines
- Three cards for five to eight lines
- Speeds from 37.5 to 9,600 bits-per-second (bps), controlled by programming. Multiple-line ACC can handle up to $2,400 \mathrm{bps}$ on all eight lines.
- Half-duplex operation.

Local attachment connector

- ACC single-line control and ACC 4 -line adapter may be locally attached without modem.

Figure 6-9. Cable and signal connections for ACC features

- Binary synchronous communication features available in single or multiple lines (up to eight lines).
- Single-line BSC is one feature circuit card.
- Multiple-line BSC is two or three feature cards (one control card and one or two adapter cards)
- Two cards for one to four lines
- Three cards for five to eight lines
- Medium-speed, single-line BSC handles speeds up to $9,600 \mathrm{bps}$; high-speed, single-line handles speeds up to 56,000 bps.
- Multiple-line BSC handles up to $9,600 \mathrm{bps}$ on lines $0-1$; up to $2,400 \mathrm{bps}$ on lines $2-7$. When only four lines are used, each line can handle up to $4,800 \mathrm{bps}$.
- If modem does not supply clocking, a jumper wire can be installed on the feature cards to provide internal (business-machine) clocking. Available only on medium-speed feature. Internal clocking speeds are 600 or $1,200 \mathrm{bps}$ (under program control).
- Half-duplex operation.

## Feature 2090

- Synchronous data link control for RS-232C interfaces.
- SDLC is a one-feature circuit card.
- Speeds of 600 or $1,200 \mathrm{bps}$ using internal clocking; up to 19,200 bps using external (modem) clocking.
- Internal (business-machine) clocking connected by jumper on feature card.
- Half-duplex operation.
- Full-duplex operation with two feature cards.

## Feature 2080

- Synchronous communication single line control/HS attachment for X. 21 or V. 35 interfaces.
- SDLC/HDLC or BSC in a one-feature circuit card.
- Speeds of 9,600 or 48,000 bps with internal clocking; speeds up to $56,000 \mathrm{bps}$ with external clocking V. 35 DCE; speeds up to $48,000 \mathrm{bps}$ with external clocking X. 21 DCE.
- Internal (business-machine) clocking for local attachment connected by customer supplied cables (see Figure 6-14 part 4).
- Half-duplex operation for SDLC/HDLC or BSC.

- Full-duplex operation for HDLC.

## Feature-Programmable Multi-Line Communications

- Synchronous or asynchronous programmable communication control features available on multiple lines (up to cight lines).
- Two or three feature cards (one control card and one or two adapter cards).
- Two cards for one to four lines
- Three cards for five to eight lines
- Speeds from 37.5 to $19,200 \mathrm{bps}$ are programmable. It

Series/ 1 cight lines). can handle up to $19,200 \mathrm{bps}$ on each line (aggregate throughput is $64,000 \mathrm{bps}$ at $12 \mathrm{bits} /$ character) .

## DCE data-set attachment features . . .

## Feature 4730

- Two lines per feature.
- One feature circuit card with connections for two external data sets (modems).
- Asynchronous mode at speeds of 45 to $1,200 \mathrm{bps} ; 2,400$ bps; $4,800 \mathrm{bps}$; or $9,600 \mathrm{bps}-$ using internal clocking.
- Synchronous mode at speeds up to $9,600 \mathrm{bps}-$ using modem clocking.
- Half-duplex operation.

## Feature 4731

- Single line per feature.
- One feature circuit card with connections for one external data set (modem).
- Asynchronous mode at speeds of 45 to $1,200 \mathrm{bps} ; 2,400$ bps; $4,800 \mathrm{bps}$; or $9,600 \mathrm{bps}-$ using internal clocking.
- Synchronous mode at speeds up to 9,600 bps-using modem clocking.
- Full-duplex operation.

## TTY current attachment feature . .

- Two lines per feature.
- One feature circuit card with connections for two unipolar dc teletypewriters.
- Speeds of 45 to $1,200 \mathrm{bps} ; 2,400 \mathrm{bps} ; 4,800 \mathrm{bps}$; or 9,600 bps-under program control.
- Attached devices must supply current source for send and receive circuits ( 20 to 60 mA ).
- Half-duplex operation (two or four wire).

TTY current attachment (feature 4734)

Rear view of 4987 unit

Figure 6-23. Teletypewriter (TTY) current attachment feature

Figure 6-24. Cable and signal connections for TTY current loop attachment feature

DATA-PHONE Digital Service attachment feature...

- One line per feature, non-switched only.
- One feature circuit card with connections to a channel service unit.
- Synchronous mode at speeds of $2,400 \mathrm{bps} ; 4,800 \mathrm{bps}$; or $9,600 \mathrm{bps}$-using modem clocking.
- Half-duplex or full-duplex operation.

Cable connection from card to modem (see Figure 6-26)

Local attachment features . . .

## Asynchronous local attachment ...

- Two lines per feature.
- One feature circuit card with connections for two local devices (terminals or systems)-without the use of modems.
- Speeds of 45 to $1,200 \mathrm{bps} ; 2,400 \mathrm{bps} ; 4,800 \mathrm{bps}$; or 9,600 bps-under program control.
- Half-duplex operation.

## Synchronous local attachment .

- Two lines per feature.
- One feature circuit card with connections for two local devices (terminals or systems)-without the use of modems.
- Speeds of $600 \mathrm{bps} ; 1,200 \mathrm{bps} ; 2,400 \mathrm{bps} ; 4,800 \mathrm{bps}$; or $9,600 \mathrm{bps}-$ manually selectable on the feature circuit card.
- Half-duplex operation.Cable connection from card to devices (see Figure 6-28)

(feature 2132)

Figure 6-28. Cable and signal connections for local attachment features

Auto-call attachment feature . . .
$\Delta \quad$ One line per feature.

- One feature circuit card with connections for one external modem and one auto-call unit.
- Modem connection same as feature 4730 (see Figure 6-19).
- Auto-call connection is for use with Western Electric type 801 Automatic Calling Unit, or equivalent.Cable connection from card to modem (see Figure 6-30)

4987 Programmable

Rear view of 4987 unit

Figure 6-29. Auto-call attachment feature

Signal connections for modem (feature 2130)

Integrated-modem attachment features.

- Eight feature circuit cards available for connection to communication lines.
- One line per feature.
- Asynchronous speeds of 45 to $1,200 \mathrm{bps}$; synchronous speeds of 600 bps or $1,200 \mathrm{bps}$ under program control.
- CCITT V. 23 or WE 202 mode-manually selectable on feature card.
Feature 4746-modem for asynchronous switched network (U.S.) . . .
- Auto-answer (CBS coupler) or manual answer (CDT coupler) options-manually selectable on feature card.
- Requires Type II local loop lines for speeds over 300 bps.
- Full-duplex or half-duplex operation.

Feature 4747 -modem for asynchronous leased line with switched network backup (U.S.) . . .

- Switched network includes auto-answer (CBS coupler) or manual answer (CDT coupler) options-manually selectable on feature card.
- Requires C1 conditioned leased lines for speeds over 600 bps .
- Full-duplex or half-duplex in leased-line mode; half-duplex only in switched-network mode.
Feature 4748 (U.S. and Canada) and 4749 (non-U.S. and Canada)-modem for asynchronous leased line .
- Requires Cl conditioned lines for speeds over 600 bps .
- Full-duplex or half-duplex operation.

Feature 4751-modem with clock for synchronous switched network (U.S.) . . .

- Business machine (internal) clocking.
- Auto-answer (CBS coupler) or manual answer (CDT coupler) options-manually selectable on feature card.
- Full-duplex or half-duplex operation.

Feature 4752-modem with clock for synchronous leased line with switched network backup (U.S.) . .

- Business machine clocking.
- Switched network includes auto-answer (CBS coupler) or manual answer (CDT coupler) options-manually selectable on feature card.
- Full-duplex or half-duplex in leased-line mode; half-duplex only in switched-network mode.
Feature 4753 (U.S. and Canada) and 4754 (non-U.S. and Canada)-modem with clock for synchronous leased lines...
- Business machine clocking.
- Full-duplex or half-duplex operation.

4987 Programmable Communications Subsystem Frons

Figure 6-31. Integrated-modem attachment features

Figure 6-32. Cable and signal connections for integrated-modem attachment features

EIA extension cable (feature 2100) . . .

- 6-m (20-ft) cable with connectors.
- Used for extending cable connections to attachment features $4730,4731,4739,4740$, and 4743 with feature 2130.
- Provides direct end-to-end connection between connector pins $2,3,4,5,6,7,8,13,14,15,16,17,20,22$, and 23.
- Limits on the number of extension cables that can be used. See the chart below. Also consult modem and terminal suppliers for distances greater than 50 ft .

## Chapter 7. Electrical power and grounding

The purposes of this chapter are to:

- Describe the power and grounding needed for the best Series/ 1 performance.
- Guide you in evaluating existing power and grounding.
- Guide you in installing or modifying power and grounding.

Series/1 rack enclosures contain power-distribution panels as shown in Figure 7-1.

Rack-mounted units connect to duplex outlets on the enclosure's power-distribution panel.

- Rack enclosures connect to customer power outlets.
- Rack-mounted units connect to power-distribution panel in rack enclosure.
- Stand-alone units connect to customer power outlets.

Figure 7-1. Series/1 rack-enclosure power distribution

A power cord from the 4997 power-distribution panel connects to your power outlet.
Stand-alone units also connect to your outlets-not to the power-distribution panel in the 4997 rack enclosure.

Voltage ranges for the Series/1 units are included in the following list. (See Chapter 5 for individual unit voltages.)

## Power quality

Dedicated Power

Your company must provide dedicated electrical power for Series/1. Dedicated means for Series/1 only.

Figure 7-2 shows the elements involved in providing reliable design for the power source supplying a computer system. You should have a dedicated branch-circuit feeder for your Series/1, as shown in Figure 7-2. From the dedicated feeder, you need separate branch circuits (protected by circuit breakers or fuses) to supply each Series/1 outlet (receptacle). You should not plug units with a high frequency power supply into ground fault interrupt outlets.

Line voltages must be maintained within the tolerance of the rated voltage-measured at the

Series/1 power outlet. See the unit specification section for the frequency tolerance of each unit type. Also see, Primary Power Line Frequency in this chapter for system related primary power line frequency considerations.

You must also comply with all national and local safety standards that apply to your site. (For installations in the U.S., see Chapter 9 of this manual.)

## Power Disturbances

The stability of your power can make a big difference in the performance of your Series/1. Power disturbances or transients can cause computer failures or errors.

Transients can come into your site on the power-company lines, but they are more often caused by some of your own equipment. For example, transients can be produced by welders, cranes, motors, induction heaters, elevators, X-ray equipment, florescent lighting, copy machines, and other office equipment.

The best way to prevent problems caused by power disturbances is to not have any transient-producing equipment on the same power service that feeds Series/1.

## Power Isolation

If your best available power source has too many disturbances for Series/ 1 , you might have to isolate your power source with an isolation transformer. The severity of the disturbances might require that the isolation transformer include electrostatic shielding and electronic voltage regulation.

## Power load

The first step in planning power distribution to your Series/1 power outlets is calculating the total Series/1 power load in kilo-volt-amperes (kVA).

Go back to the product-specification worksheet you filled out in Chapter 2 of this manual. Add up the total kVA for the units listed on the worksheet, then refer to "Primary power limits" on page 5-115 or page 5-117 to be sure you do not exceed the limits of your 4997 Enclosure. Figure 7-3 shows an example of total power load for a single rack enclosure and associated stand-alone units.

These are maximum values for a full featured unit. Your machine will probably be less than maximum. For a more precise value of the power load for your machine, contact your IBM marketing representative.

You need the total power load (in kVA) of all racks and units to determine the proper size of your branch-circuit feed (see '"Branch-Circuit Feeder").

## Power distribution

## Power Outlets

For each Series/1 rack enclosure, you need a separate power outlet on a separate branch circuit (see Figure 7-2).

You also need an individual power outlet for each stand-alone unit. We urge you to use a single outlet (not duplex) for each stand-alone unit to prevent someone from connecting equipment other than Series $/ 1$ to the other half of the duplex outlet.

Note: If you have a stand-alone processor Model 4952-30D, 4954-30D, 4954-60D, 4956-30D, or 4956-60D that is connected to a 4965-30D or 4965-60D Storage and I/O Expansion Unit, you must use a duplex outlet. In this configuration, the line cords of the two units are physically joined but have two separate plugs. This arrangement makes it impossible to reach two separate single outlets.

Specifications for outlets (receptacles) are given in Chapter 5. In countries other that the U.S. and Canada, Series/1 units are shipped without the powerplugs attached to the power cords. Some national or local safety standards may require a different type of plug, or direct wiring of the power cords, instead of a plug-in connection.

## Branch Circuits

Make sure that the branch circuits supplying your Series/1 power outlets (see Figure 7-2) are large enough to handle the specified power outlets and the power load of units being supplied. While each rack enclosure requires a separate branch circuit, you may connect several outlets for stand-alone units to a single branch circuit-but do not exceed the circuit's capacity.

Branch circuits must be protected at the branch-circuit distribution panel with a time-delay circuit breaker or fuse for each circuit. In-rush current for Series/ 1 units can be up to 10 times the rated load for the first one-half cycle.

If you have three-phase power to the branch-circuit distribution panel, you should balance the power-outlet loads on the individual phases.

## Branch-Circuit Feeder

Make sure that the feeder wires to the branch-circuit distribution panel (see Figure 7-2) are large enough to handle the total Series/ 1 power load (refer to your product-specification worksheet). This feeder can be three-phase, but Series $/ 1$ requires only single phase at the individual power outlets.

## Power Source

The primary power source shown (see Figure 7-2) is a typical wye-type, three phase service coming from service entrance or separately derived system with . appropriate over-current protection and suitable ground (service entrance or building ground).

## Primary Power Line Frequency

The accuracy and stability of the line frequency must be considered when evaluating your primary power source. Series/1 machine types have various frequency tolerances, some are 60 Hz (or 50 $\mathrm{Hz}) \pm 0.5 \mathrm{~Hz}$, some are $47-63$ Hz . It is possible, if the frequency were to drop to 59.4 Hz , for some machine types to continue operation while the other machines have experienced a power failure. This characteristic must be carefully considered when doing system planning, especially with systems that are to be supported by emergency power sources.

In critical applications, switching to an emergency power source may be necessary if the line frequency variance exceeds $\pm 0.5$ Hz , even if the line voltage has remained within tolerances.

## Emergency power control

The Series/ 1 rack enclosure is protected by a 20 -ampere circuit breaker on the power-distribution panel. This circuit breaker can be mechanically tripped from the instant-power-off (Emergency Pull) control on the front of the rack enclosure (see Figure 7-1).

You may have to provide emergency-power-off (EPO) controls for disconnecting your power service. To find out if this is necessary, check applicable national and local safety standards. If so, your emergency controls must disconnect the power service to the computer, as well as other equipment in the computer area or room, except lighting. The EPO controls should be located close to the computer itself and, in the case of a computer room, close to the exits.

You should also provide emergency lighting for the computer site. The AC distribution panel in the 4997 rack must be used to supply power to all the machines included in the rack.

This is a necessity in terms of safety. The emergency pull button serves as the instant power off function for an emergency power down of the entire contents of the rack. For this reason devices in the rack must not receive power from another rack or an external outlet.

The maximum allowable current load of the AC distribution panel is 16 amperes which must be considered if you intend to locate non-IBM equipment in the 4997 rack. IBM cannot be involved in any warranty considerations for non-IBM equipment.

## Other power needs

You will also need power for other equipment at your Series/1 site. You should have two convenience outlets within 6 feet of your Series/ 1 for service and test equipment. You also need power for lights, air-conditioning, telephone equipment, and production equipment.

All non-Series/ 1 equipment must be powered from a source other than the Series/1-dedicated branch-circuit distribution panel.

## Grounding

A common cause of computer problems is improper grounding.

Series/ 1 power cords contain an insulated equipment-grounding wire (green or green with yellow stripe) that connects the machine frame to the equipment ground at the power outlet. All bays of a 4997 multibay enclosure must be connected to the same primary power ground.

Connect the power outlets for Series/1 units with an equipment-grounding wire to a grounding terminal bar in the branch-circuit distribution panel. Connect the grounding terminal bar with an equipment-grounding wire back to the service-entrance grounding electrode (see Figure 7-2).

The grounding wire must be an insulated, noncurrent-carrying conductor, of at least the same size as the branch-circuit feeder. While the grounding wire can be run in the same conduit as the other wires, keep it electrically isolated from the neutral wire. The center tap of the service transformer (neutral) and the grounding wire are common only at the service-entrance grounding electrode.

If you cannot run the grounding wire back to the service entrance (such as in a tall build-
ing), you can use an exposed section of a cold-water main that has continuous metal to ground.

You may have to use building steel or grounding rods if no other grounding means are available. All grounds must be tested. Check applicable national and local safety standards.

Grounding continuity is vital to sensor input/output equipment connected to Series/1 (see "Safety considerations" in Chapter 8).

## External unit grounding

Series/ 1 machine types mounted external to the system enclosure must use the same ground circuit as the processor. No more than 0.5 Vdc of ground voltage differential may exist between any grounds on the Series/ 1 system. This requirement is particularly important when extended ( $>30 \mathrm{~m}$ ) attach cables are used with the 4979 Display Station and the 4978 Display Station.

## Lightning protection

If you are located in an area that is subject to electrical storms, talk to your power company about installing lightning protection on your building service. You might also need to install lightning protection on your power-distribution system.

Figure 7-2. Sample electrical power distribution and grounding for Series/1

- Customer specifies voltages when ordering Series/1. See your records for voltages.
- The values given for power load (kVA) are upper limits and occur when the unit is powered on. During operation, the value of the power load (kVA) will probably be less.
- Each 4997 rack enclosure has a current (ampere) and power load (kVA) limit. See "Power Requirements" and "Primary power limits" under the 4997 unit specifications in Chapter 5.
Figure 7-3. Sample Series/1 power load (single rack enclosure)

## Battery backup unit (4999)

If you had power outages or brown-outs in your area, a battery backup unit may have been ordered for your installation. Check your product-specification worksheet for machine-type 4999. The battery backup unit only provides power backup for certain Series/ 1 processors.

If you are getting battery backup at your site, there are several things you need to do to prepare for it. You must supply the following:

- The battery (we recommend the sealed automotive type, 12 -volt, 100 ampere-hour rating)
- The battery cables
- Battery-charging equipment
- Electrical power for battery-charging equipment.

Figure 7-4 shows the battery-connection block on the 4999 unit. The connection block takes stranded, insulated cables from size No. 8 to No. 2 AWG. You should label the polarity of the cables ( + and - ), and twist them together to reduce inductance and electrical noise. Maximum battery cable length is 4.1 meters ( 13.5 feet), using No. 2 AWG wire.

Connect the battery cables to the 4999 after your computer has been installed.

Figure 7-4. Battery connection for 4999 Battery Backup Unit

## Chapter 8. User-equipment wiring

Series/ 1 offers a variety of options for connecting (or attaching) user or other IBM equipment-depending upon the type of equipment and its use. Users can choose from several available attachment features designed for attaching their equipment to Series/1.

The purposes of this chapter are:

- Explain how user equipment is physically connected to Series/1.
- Guide you in selecting and installing the necessary wiring from your equipment to Series/1.

Your job is to install or coordinate the installation of the wiring for your equipment before your Series/ 1 arrives. ${ }^{3}$ You will also make the connections to your Series/ 1 after it has been installed and checked out by the IBM customer service representative.

User-attachment features are optional circuit cards and cables. These cards are located in the Series / 1 processor, I/O expansion unit, 4965 , or sensor I/O unit-depending upon the type of card and the particular Series/1 configuration ordered.

Your equipment is wired directly to the circuit cards or to an optional customer access panel. When estimating the cable length required to connect from an IBM feature in a machine type installed in a Series/ 1 enclosure to any external device allow $2-2.5 \mathrm{~m}(6-8 \mathrm{ft})$ for a 4997-2 and $1.5-2.0 \mathrm{~m}(4-6 \mathrm{ft})$ for a 4997-1 for cable routing through the enclosure.

Figure $8-1$ is an overview of the various user-attachment features and their location in the Series/1 units.

It is beyond the scope of this manual to discuss all the types of user equipment that can be attached to the Series/1. Someone in your company has already determined what equipment you will be attaching to your Series/1 and has ordered the necessary Series/ 1 features.

## User-attachment features

Attachment-feature circuit cards located in processor or I/O expansion unit...

- Timer feature
- Two 16-bit timers per feature card
- User connections to card or to customer access panel
- User-supplied wiring
- Integrated digital input/output, nonisolated
- 32 points of digital input/process interrupt and 32 points of digital output per feature card
- User connections to card or to customer access panel
- User-supplied wiring
- Teletypewriter adapter
- For attaching start-stop I/O devices
- Full-duplex; speeds up to 9,600 bps
- User connections to card or to customer access panel
- Optional device cables available
- Direct program control adapter
- For attaching up to 16 user devices
- User connections to card or to customer access panel
- User-supplied wiring
- Sensor l/O unit attachment
- Printer Attachment - 5200 Series
- Attachment feature cable
- Two ports attach up to eight 5200 Series printers
- Multidrop Workstation attachment feature
- Attachment feature cable
- Four ports attach up to eight 4980 display stations

## 5250 Information Display System

 attachment feature- Attachment feature cable
- Four 5250 station attachment ports
- Up to eight 5250 stations can be attached
- IEEE 488 General Purpose Interface Bus (GPIB) attachment feature

20] Attachment-feature circuit cards located in 4982 Sensor Input/Output Unit...

- Available feature cards are
- Analog input control (one card per unit)
- Amplifier multirange (one card per unit)
- Multiplexer/reed relay (eight channels analog input per card)
- Multiplexer/solid state (sixteen channels analog input per card)
- Analog output (two points per card)
.- Digital input/process interrupt, nonisolated (sixteen points per card)
- Digital input/process interrupt, isolated (sixteen points per card)
- Digital output (16 points per card)
- User connections to feature cards
- User-supplied wiring

Figure 8-1. User-attachment features

## Planning and installing user-equipment wiring

Attaching user equipment to a computer requires electronic know-how. Unless you have an instrumentation expert in your company, we recommend that you get qualified outside help with connecting your equipment to Series/1.

In any case, certain planning and installation guidelines should be followed. These guidelines are covered in the following pages.

## What's coming

In Chapter 2, you filled out a product summary worksheet for Series/ 1 machines on order. You should do the same job for Series/1 user-attachment features on order.

First, make copies of the user-attachment-features summary worksheet (Figure 8-8).

Next, find out the specific user-attachment features on order. Refer to your company's copy of the Series/ 1 purchase agreement.

Then, check the types and enter the quantities of feature cards and cables on the summary worksheet. This worksheet will be your record of user-attachment features for use in your planning and coordinating tasks.

Be sure to review the scheduling recommendations in Chapter 1 of this manual to help you plan for a timely installation.

## Preparing an installation plan

To properly coordinate the wiring of your equipment to Series/1, you should have an installation plan for your equipment. Someone in your company may have made such a plan when Series/1 was ordered. If not, we recommend that you prepare one to help you with your planning and coordinating tasks.

Suggested items to include in your installation plan are as follows:

- Location and type of equipment.
- Location of Series/1.
- Specific Series/1 features that your equipment will connect to.
- Type of feature connection (direct-to-card, customer access panel).
- Cables/connectors supplied with Series/ 1 features.
- Connectors ordered as accessories.
- Cables/connectors that you will supply.
- Feature addresses, feature card location, and signal connections. (Get these from your programmer or systems engineer. You need these for the specific connections to a feature card for a specific device.)
- Wiring schematics or diagrams for your equipment.
- Building layout drawings. (You need these for planning cable routing and determining cable lengths.)

## Outdoor cabling restrictions

Outdoor local interconnections are prohibited unless specifically allowed to do so, as indicated in the feature description section (user equipment wiring-section 8) of this manual. Such interconnections require the use of primary surge protectors at building entrances and exits. Refer to "Outdoor Cabling" (Site Safety - Section 4) and "Lightning Protection" (User-equipment wiring-Section 8).

## Attachment features

As part of your installation plan, record the specific information needed to connect each of your devices to the appropriate Series/ 1 feature. Make copies of the user-attachment-features planning worksheet (Figure 8-5).

Record the information for your equipment as shown in the sample worksheet in Figure 8-2. You can then use your worksheet for the actual connections of your wiring to Series/1 after it has been installed and checked out by the IBM customer service representative. It will also be a valuable reference for changes and trouble-shooting later on.

User-attachment-features planning worksheet

Figure 8-2. Sample user-attachment-features planning worksheet

User-attachment-features planning worksheet

## Selecting signal cable

For sensor and other instrumentation connections to Series/1, we strongly recommend that you use shielded, stranded, twisted-pair cable with a suitable outer protective covering, coax cable, or twinax cable-depending on the application. Twisted-pair cable is commercially available with multiple individually shielded twisted pairs, or with one shielded twisted pair. The shield may be either a braided shield or a foil shield with a drain wire (Figure 8-4).

Some important points on cable selection and use are as follows:

- Instrumentation cable with a foil shield is best for low-speed digital and all analog signals.
- Coax cable is best for high-speed digital signals.
- Analog and digital signals should not be mixed within the same multiple-pair cable, or within the same group of single-pair cables.
- DI and DO signals should not be mixed within the same cable.
- Outer protective cable covering must be designed for the environment (temperature, humidity, chemical contamination) in which the cable is used.
- All shielded cable must have an insulated outer covering.

Single twisted-pair cable

Multiple twisted-pair cable

Coax cable

Twinax cable

Figure 8-4. Types of signal cable .

## Wiring methods

Like cable selection, the way you install your wiring will also affect the success of your installation.

Be sure to comply with all national and local safety standards relating to low-voltage signal wiring (see Chapter 9 for U.S. installations).

Routing Signal Cable
All Series/ 1 cables available from IBM are jacketed with polyvinyl chloride (PVC), except twinaxial cables, which may be jacketed with Teflon. ${ }^{4}$ National Electric Code (NEC) requires that PVC cables routed through air plenums be protected by conduit. Except where prohibited by local codes, Teflon ${ }^{4}$ jacketed cables may be run through air plenums without conduit protection.

Be very careful about routing your cables near equipment that can cause electrical interference (noise) in the circuits. Noise, which is an unintended and unwanted electrical signal, can cause your computer to make errors.

Noise is often caused in signal cables that are parallel with other wiring for long distances. Keep signal cables at least 0.3 meters (1 foot) away from any power line or other ac wiring.

Also, keep your signal cables as short as possible. The longer the cable, the greater the chance of noise and signal weakening. Where multiple signal cables connect your equipment to the computer, use the same general route for all the cables.

[^6]Many kinds of equipment can cause noise on signal cables if you route your cables too close to them. Some of the common noise-causers are as follows:

- Fluorescent, neon, and incandescent lighting fixtures
- Power-distribution wiring, transformers, generators, and alternators
- Motors that drive machinery, such as air conditioners, elevators, escalators, large blowers, and machine tools
- Radio and television transmitters, including citizens-band and public-service equipment
- Signal generators, intercommunication systems, and security systems
- Arc welders, electro-discharge machining equipment, and related equipment
- Radar transmitting equipment
- R.F. induction heaters
- Radio therapy equipment
- Ultrasonic cleaning equipment
- Electromagnetic equipment, such as degaussers and magnetic chucks
- Control equipment (relays, contactors) for machinery and other switching devices that carry or switch relatively large currents.

## Signal Conditioning

The use of signal conditioning circuits or techniques may be necessary to obtain satisfactory performance (lack of noise) from your signal cable circuits.

Because of the complexity of signal conditioning techniques, you may need to consult an electrical engineer on how to install "noise conditioners" on your signal wiring circuits.

## Grounding Signal Wiring

Proper grounding of your signal wiring will reduce noise as well as make your installation safe. Some special reminders on grounding signal wiring are as follows:

- Be sure shielded cables have an insulated outer covering or jacket.
- For cables that run between buildings, ground the shields at the junction boxes where the cable enters and leaves the buildings. Be sure not to break the continuity of the shield at the grounding points.
- If there are unused twisted pairs in a cable, connect them together at one end and ground them at the other end of the cable (at the same point that you ground the shield or drain wire).
- User-equipment ac and dc grounds should have only one common point within a system.
- Ground all cable body shields at the point they enter a Series/ 1 enclosure. The point of grounding varies for individual features.
- When connecting directly to feature cards located in the processor, 4965, or I/O expansion unit, ground the cable shields to the frame of the 4997 enclosure using grounding cable clamps.
- When connecting directly to feature cards located in the processor, 4965 , or I/O expansion unit, ground the cable shields to the frame of the 4997 enclosure using grounding cable clamps.
- When connecting to the customer access panel, ground the cable body shield to the access panel using the threaded screw holes provided, as shown in Figures 8-37 and 8-44.
- When connecting to the 4982 sensor I/O features, ground individual conductor shields to the card connector. Body shields should be grounded to the frame of the Series/ 1 enclosure at point of entry using grounding cable clamps.
- If grounding cable shields at the Series/ 1 end does not eliminate noise, try grounding the shields at both ends of the cable. If noise persists, try grounding the shields at the remote end only.
- Do not use building framework, conduits, or sprinkler systems for dc grounding. Service-entrance ground, a cold-water main (with continuous metal to ground), a special grounding bus, or an approved grounding rod is acceptable (see Figure 7-2).

## Lightning protection of communication circuits

Lightning or other sources can cause high surges of electrical energy in signal circuits. While it is not possible to prevent all surge related lightning problems, proper grounding and bonding of equipment and the use of surge suppression devices will reduce the effects of surges.

A sample shunt-type protector shown in Figure 8-5 allows normal current flow in the signal circuit, but shunts (or shorts) surge current to ground.

Refer to applicable national and local safety standards for lightning-protector requirements (see Chapter 9 for U.S. installations).

Note: Circuitry to be protected and protect devices can be mutually incompatible. Therefore, indiscriminate use of protectors is not recommended.

Junction-box detail

Figure 8-5. Sample shunt-type lightning protector

## Checking signal wiring

You can save yourself some time and trouble by thoroughly checking your signal wiring before your computer arrives. The following are some of the things you should check:

- Polarity of twisted pairs. Check to see that wires are not crossed where polarity must be maintained.
- Open circuits in individual wires or shields.
- Short circuits between wires of the same or other pairs.
- Ground on individual wires. Check for shorts between wires and shield, between wires and grounded equipment, or between a shield and unintended grounds.
- High wire resistance. Check the resistance of twisted pairs against the specifications for the particular size and type of wire.

## Updating your installation plan

Earlier in this chapter (see "Preparing an installation plan"), you were advised to plan the installation of your wiring in as much detail as possible. There are some important details that you might not be able to record in your plan until you actually install your wiring. In any case, you need to record the items listed here as a reference for later changes and trouble-shooting.

Review your installation plan and update it where necessary for the following items:

- Types of cables used.
- Cable lengths between your equipment and Series/1.
- Color code and labeling of wires.
- Types and locations of junction boxes.
- Location of splices.
- Locations where cables enter or leave interior walls, ceilings, floors, or exterior walls.
- Types and locations of lightning protectors.
- Locations of outside cable routes.
- Spare cable parts.
- Polarity of wire connections.
- Locations of grounding points.
- Types and locations of other equipment that could cause noise on your signal cables.

## Connecting to Series/1

After your Series/1 arrives and has been checked out by the IBM customer service representative, connect your wiring to the user-attachment features.

To make your connections, you need to refer to the following items:

- Your installation plan.
- The section in this chapter that shows the physical connections for your features (see Figures 8-27 through 8-70).
- The installation instructions and diagrams shipped with Series/1. The installation instructions give you detailed information on cable routing inside the rack enclosure.

## Safety considerations

Equally important with an installation that works well is an installation that is safe for people and equipment. Be sure to review your company's safety procedures as well as Chapter 4 of this manual. Some special reminders on safe connection of your equipment to Series/1 are:

- Be sure that your wiring complies with national and local safety standards. In particular, hazardous areas require additional precautions. (See Chapter 9 for U.S. installations.)
- Grounding continuity is vital to sensor input/output equipment connected to Series/1. Where remote sensors or power supplies are grounded to Series/1, disconnect all sensor wiring before disconnecting the Series/1 power cord. Otherwise you can cause serious damage to your equipment as well as create a SHOCK HAZARD.
- Before switching Series/1 power off, be sure that equipment controlled by Series/ 1 is ready for powering off. Otherwise, you can cause serious damage to your equipment.

## Class 2 circuits

The following Series/ 1 features, when installed in an IBM 4952, 4954, 4955, 4956, 4959, 4965, 4982, or 4987 machine type, provide an interface which is within the limited power source requirements of class 2 circuits (remote-control, signalling, and power-limited circuits) as specified in Article 725 C of the National Electrical Code (NFPA no. 70).

Feature Name/Description

## 1310 Multifunction attachment

1400 Local Communication Controller
1560 Integrated Digital Input/Output Non-isolated
1610 Asynchronous Communications SingleLine control

7840 Timers
7850 Teletypewriter Adapter D02118 GPIB Adapter (IEEE 488)

D02350 RS-422 Communications 8 -Line Adapter

## Basic information

## User applications

## Sensor I/O

One of the options available for controlling user equipment is the 4982 Sensor Input/Output Unit (refer to the 4982 Description Manual for signal interface specifications).

The 4982 is used with Series/1 to monitor and control user processes (Figure 8-6). Sensors installed in equipment send digital or analog input signals to the computer. The input signals represent the status of the activity being monitored, and the computer translates the signals into meaningful data. The computer can be programmed to accept the input signals on a priority basis, measure and/or record the data, check the data against predetermined standards, and return output signals to the attached equipment.

Sensor I/O can be used in many ways. For example, it can be used to monitor large numbers of manufacturing machines, to control one or more continuous or batch processes, or to monitor one or more sensor-based inputs from a test instrument. Input signals to the computer can come from analog transducers or from digital sources, such as contact closures.

Computer output, both analog and digital, can be used to control many kinds of displays, recorders, and control mechanisms.

Designed for flexibility, Series/ 1 with sensor I/O can handle a variety of applications, such as:

- Data acquisition
- Process control
- Plant automation
- Laboratory automation

Figure 8-6. Sample plant-automation application

## Integrated Digital Input/Output

Another option available for controlling user equipment is the integrated digital input/output (DI/DO) feature.

A simple example of an application of this feature is the controlling of air conditioning equipment (Figure 8-7).

Figure 8-7. Sample energy-conservation application

In this example, when the thermostat senses $22^{\circ} \mathrm{C}\left(72^{\circ} \mathrm{F}\right)$, the wire connected to the Series/ 1 says "switch on the air conditioning." And when the thermostat senses $20^{\circ} \mathrm{C}\left(68^{\circ} \mathrm{F}\right)$, the wire to Series/ 1 says "switch off the air conditioning." The wires from the thermostat to Series/ 1 are the digital input (DI).

The set of wires from Series/ 1 to the air conditioner tells the air conditioner to switch on or switch off. These wires are the digital output (DO).

The computer uses the information received from the thermostat to control the air conditioner according to the instructions the user has given to the computer in its program. Controlling the air conditioner may be part of an overall energy-conservation plan.

In a similar way, other user devices, such as counters, gauges, and switches, can be monitored. The associated user equipment can be controlled by Series/ 1 with the integrated DI/DO or sensor I/O features.

## Otker applications

Other features available for attaching user equipment to Series/1 are as follows:

- Timer feature
- Teletypewriter adapter
- Direct program control adapter
- GPIB adapter.

These features allow the user to attach various kinds of equipment-such as data processing input/output devices, data-acquisition systems, other computers, test instruments, and other custom devices.

## Terminology

Some of the common terms associated with the user-attachment features are as follows:

Digital in (DI). Can be one of two types of signal input to the computer-voltage sense or contact sense. Voltage sense has two states, on and off. The most common voltage levels sensed are 0 volts and 5 volts dc. Contact sense refers to sensing the opening or closing of an external set of contacts, with the voltage for the circuit provided by the computer.

Digital out (DO). DO is a similar signal to DI voltage sense, except DO is an output from the computer to an external device to control something.

Analog in (AI). An input signal to the computer from some external control device. This type of signal is much more critical than a digital signal because every change in voltage (no matter how small) means something. An analog signal should be as free as possible from interference or noise. The computer may continuously sample the voltage value of the signal to make decisions.

Analog out (AO). The same type of signal as AI, except AO is an output signal from the computer used to control some external device.

Process interrupt (PI). An input signal that alerts the computer to stop what it is doing as soon as possible and do something with the digital input that is waiting to be read by the computer.

Sensor. A device or instrument that senses an action or value in a user process, such as closing a switch or sensing degrees from a thermometer. Sensors also convert such actions or values into a voltage output that is usable by the computer.

GPIB. The term "General Purpose Interface Bus" (GPIB) is commonly used to identify the Institute of Electrical and Electronics Engineers Standard 488 as approved in 1975 (IEEE 488-1975). This interface standard was established to facilitate the interconnection of programmable instrumentation and other system components. Refer to Figure 8-47 for user connection directly to the GPIB feature card.

## Series/1 user-attachment features

## Features summary

You will need to refer to this figure later in this chapter when you count your user-attachment features.

Figure $8-8$ summarizes user-attachment feature cards and cables.

| Feature | Feature |
| :--- | :--- | :--- |
| description |  |

Figure 8-8 (Part 1). User-attachment-features summary worksheet

User-attachment-features summary worksheet (part 2)

Figure 8-9 (Part 2). User-attachment-features summary worksheet

## Cable features and connecting options

Cable features are available from IBM for connecting to several of the user-attachment features. These cables and their uses are shown in Figures 8-10 through 8-25.

In most cases, you will supply wiring (cables and connectors) from your equipment to the user-attachment features. The feature descriptions in this chapter indicate where user-supplied cables and connectors are required. (Also see "Selecting signal cable" in this chapter and "Feature-Connector Summary" in Chapter 9.)

Figure 8-26 shows three optional methods of connecting user equipment to Series/1 features. The actual method that you will use depends upon your application and the specific features your company has ordered.

While several connecting options can be used with some features, only one specific method can be used for the other features. The connecting options for each feature are described in detail in this chapter.

Series/ 1 processor (or I/O expansion unit) Connects directly from feature card to teletypewriter.

Teletypewriter Card connector supplied with cable feature.

Internal cables from access panel to feature cards in processor or expansion unit...
Integrated DI/DO cable (feature 1593)
Card connectors and connector block/plug
for access panel supplied with cable feature.
(or)
DPC adapter cable (feature 1594). Card connectors and connector block/plug for access panel supplied with cable feature.
Timer cable. Card connector, cable, and connector block for access panel supplied with access-panel feature.
Teletypewriter cable. Card connector, cable, and connector block for access panel supplied with access-panel feature.

Customer access panel (feature 1590)

$\qquad$

Teletypewriter cable (feature 2059).
Connects teletypewriter to customer access panel. Connector plug supplied with cable feature.

Figure 8-10. User-attachment cable features

- Detailed information about the 5250 units is contained in the IBM 5250 Information Display System Planning and Site Preparation Guide, GA21-9337.
- Two attachment circuit cards per feature.
- Four 5250 station attachment ports.
- A twinaxial cable of up to $1524 \mathrm{~m}(5000 \mathrm{ft})$ is used to attach:
- 5251 Display Station (Models 1 and 11)
- 5252 Dual Display Station (Model 1)
- 5256 Printer (Models 1, 2, 3)
- A maximum of seven 5250 stations, in any combination, may be attached to a single port of the 5250 attachment.
- Each 5250 attachment feature allows up to eight 5250 stations.
- 5250 attachment cable (feature 5760).
- Detailed information about coax cable and connectors is contained in the Installation and Assembly of Coax Cable and Accessories for Attachment to IBM
- Twinaxial cable is supported for outdoor installation (see Outdoor Cable Installation in this chapter). Products, GA27-2805.

## Twinaxial Cable Assembly

Twinaxial cabling is recommended for use in attaching display stations and printers to the 5251 Model 2 or 12 Display Station or to a host system. Some host system connections must be made with twinaxial cable to ensure specified performance levels. The following are bulk cable specifications for twinaxial cable:

| Conductor | AWG wire size | 20 |
| :---: | :---: | :---: |
|  | Stranding | $7 \times 28$ |
|  | Material | Copper |
|  | Coating | Tin (1 conductor only) |
|  | Resistance | 11 ohms maximum per 305 meters (1000 feet) |
| Insulation | Material | Polyethylene |
|  | Outside diameter | 6.1 millimeters ( 0.24 inch) nominal |
| Shield | Material | Tinned copper |
|  | Type | Braid, 34 AWG, 7 ends/ 24 carriers, $9.7 \pm 10 \%$ picks/inch |
|  | Coverage | 95\% minimum |
|  | Resistance | 3 ohms maximum per 305 meters (1000 feet) |
| Jacket | Material | Vinyl |
|  | Color | Black |
|  | Average single wall thickness | 0.76 millimeter ( 0.029 inch) |
|  | Outside diameter | 8.25 millimeters ( 0.325 inch) nominal |
| Rating | Dielectric strength | 4500 Vdc for 3 seconds at $28^{\circ} \mathrm{C}\left(82^{\circ} \mathrm{F}\right)$ |
| Capacitance |  | $16.2 \mathrm{pF} /$ foot maximum |
| Impedance, characteristic |  | $\begin{aligned} & 111 \pm 5 \% \text { ohms at } 0.5 \mathrm{MHz} \\ & 107 \pm 5 \% \text { ohms at } 1 \mathrm{MHz} \\ & 105 \pm 5 \% \text { ohms at } 2 \mathrm{MHz} \text { and above } \end{aligned}$ |
| Attenuation@ 100 MHz |  | $4.5 \mathrm{~dB} / 30.5$ meters ( 100 feet) maximum at $25^{\circ} \mathrm{C}\left(77^{\circ} \mathrm{F}\right)$ <br> $4.7 \mathrm{~dB} / 30.5$ meters ( 100 feet) maximum at $80^{\circ} \mathrm{C}\left(176^{\circ} \mathrm{F}\right)$ |
| Velocity of propagation |  | $66 \% \pm 5 \%$ |
| Operating environment |  | $-40^{\circ} \mathrm{C}$ to $80^{\circ} \mathrm{C}\left(-40^{\circ} \mathrm{F}\right.$ to $\left.176^{\circ} \mathrm{F}\right)$ $10 \%$ to $90 \%$ relative humidity |

## Coaxial Cable Assembly

To accommodate users of previously installed coaxial networks, the twinaxial-coaxial adapter allows connection of twinaxial stations and systems to coaxial cable. (The adapter does not allow attachment of twinaxial cable to coaxial stations or systems.) The adapter must be used at each twinaxial-coaxial attachment point. Some systems do not permit attachment to coaxial cable. If you have an existing coaxial network, check with your IBM installation representative to see if the system you plan to install can be used with coaxial cable. The following are bulk
cable specifications for coaxial cable:

Twinaxial-coaxial adapter (IBM part 7363102, Amphenol part 82-5628, or equivalent)

|  |  | Indoor ${ }^{3}$ | Outdoor ${ }^{4}$ |
| :---: | :---: | :---: | :---: |
| Conductor | AWG wire size | 22 | 22 |
|  | Stranding | Solid | Solid |
|  | Material | Copper covered steel $40 \%$ conductivity | Copper covered steel $40 \%$ conductivity |
| Shield | Material | Copper braid | Copper braid |
|  | Type | AWG 34 | AWG 34 |
|  | Coverage ${ }^{5}$ |  |  |
| Jacket | Material | PVC | PVC ${ }^{5}$ |
|  | Average single wall thickness | Noncontaminating 0.79 mm ( 0.031 inch) | Noncontaminating 1.02 mm ( 0.040 inch) maximum |
| Rating | Ambient temperature | $60^{\circ} \mathrm{C}$ maximum | $60^{\circ} \mathrm{C}$ maximum |
| Capacitance, nominal |  | $14.5 \mathrm{pF} /$ foot | $14.5 \mathrm{pF} /$ foot |
| Impedance, characteristic |  | $93 \pm 5$ ohms | $93 \pm 5$ ohms |
| Attenuation@ 400 MHz |  | $8 \mathrm{~dB} / 30.5$ meters <br> (100 feet) maximum | $8 \mathrm{~dB} / 30.5$ meters <br> (100 feet) maximum |
| Velocity of propagation |  | 80\% | 80\% |
| DC resistance |  | 44 ohms/30/5 meters ( 1000 feet) maximum | 44 ohms/30/5 meters ( 1000 feet) maximum |

${ }^{1}$ For example, when you attach a 5251 Model 11 Display Station to a 5251 Model 12 Display Station with coaxial cable, you need two twinaxial-coaxial adapters, one at each attachment of cable to a machine.
${ }^{2}$ If your host system supports the use of coaxial cable, plan to connect adapters to your coaxial cable as soon as possible for ease of setup.
${ }^{3}$ Cable commercially designated RG 62A/U, meeting the above specifications, is an approved substitute. Cable OD $6.15 \pm 0.18$ millimeters ( $0.242 \pm 0.007$ inch $)$.
${ }^{4}$ Cable commercially designated RG 62A/U, which is modified for outdoor use (including vapor barrier and thicker cover) and which meets the above specifications, is a suitable substitute. Cable OD $6.6 \pm 0.25$ millimeters ( $0.260 \pm 0.10$ inch $)$.
${ }^{5}$ Seven ends, 16 carriers, $8.2 \pm 10 \%$ pick per inch, $90 \%$ minimum coverage.
${ }^{6}$ Jacket must meet the minimum requirements for underground feeder and branch circuit cable and must also be weatherproofed and sunlight resistant, per UL Subj. 493.

## Async Display attachment

Attachment of $3101,3161,3163$, and 3164 can be made using IBM cables (see Figure 8-16) or you may provide your own attachment cables (see Figure 8-17). Refer to the IBM sales manual for connectors and tool kits. Generally, IBM does not provide bulk cable.

The Multifunction Attachment feature \#1310 provides four serial I/O ports for connection of $3101,3161,3163$, or 3164 display terminals (refer to Figures 8-63 through 8-64 for cable information). Also see the 3101 Display Terminal Description Manual, GA18-2033, IBM 3161/3163 ASCII Display Station Description Manual, GA18-2310, or IBM 3164 ASCII Color Dislplay Station Description Manual, GA18-2317 for physical planning cable information.

Note: The $3101,3161,3163$, and 3164 direct attach are not supported for outdoor installation.

IBM Cables

| Features |  | IBM Cable \# | Figure |

Optional ways of attaching user equipment to Series/1-depending on requirements of the application and the features selected...
(ii) User connection to customer access panel at rear of rack enclosure. Internal IBM cables to feature cards in processor or I/O expansion unit. This option cannot be used for connections to the 4982 sensor I/O unit features.User connection to feature cards in sensor I/O unit. Internal IBM cable to sensor I/O unit attachment card in processor or $1 / O$ expansion unit.User connection directly to user-attachment feature cards in processor or I/O expansion unit.

Figure 8-26. User-equipment connecting options

As shown in Figure 8-27, user connections to the feature cards in the sensor I/O unit are made directly to the circuit cards. Connecting to the customer access panel is not an option for sensor I/O features.

The sensor I/O features use two different circuit-card connections depending upon the feature cards selected (Figures 8-27, 8-28 and 8-29).

For all sensor I/O features other than the AO feature card, user connections are made directly to the circuit cards with commercially available edge connectors. The sensor I/O cards (other than AO) require a 56-position connector with 3.96 -millimeter ( 0.156 -inch) contact spacing (Continental Connector Corp. connector 600-11-56XA-30 and hood $600-11-56 \mathrm{HI}$, or equivalents). The feature cards are not keyed to the connectors, so you must be sure to put the connector on correctly (observe connector contacts 1 and A at the top of the card, (see Figure 8-27).

The AO feature card does not require a special connector. User connections are made directly to screw connectors on the circuit card (see Figure 8-29).

Signal connections are identified in Figures 8-28, 8-29 and $8-36$. Before connecting them to your Series/1, verify signal connections in the diagrams shipped with the computer.

## Analog－output card connection

Figure 8－29．Signal connections for sensor I／O feature cards

## Integrated digital input/output (DI/DO)

User connections to the integrated DI/DO feature can be made in two ways-either directly to the circuit card (Figures $8-30$ and 8-31), or to the customer access panel (Figures 8-32 and 8-33).

Connections made directly to the DI/DO card require three 2 x 20 connectors (Berg Electronics connector 65405-013, with pin sockets 47712, or equivalent) as shown in Figure 8-30. The connector is polarized by plugging pin position B 02 .

Connections made to the customer access panel use a connector plug supplied with the internal cable that connects the feature card to the access panel (see Figure 8-32).

Connecting to the feature card or to the access panel requires a cable with up to 72 twisted pairs of wire. For connecting directly to the feature card, No. 24 AWG ( 0.511 mm ) twisted-pair flat cable is recommended for easier cable routing.

When connecting to a DI/DO card located in any half-width unit installed in a half-width unit enclosure, the DI/DO cable must be divided into separate cables. Each cable's bulk diameter must be less than 15 mm ( 0.59 in .). Each cable may contain up to 24 twisted pairs of No. 24 AWG ( 0.511 mm ) wire shielded and jacketed.

Signal connections are identified in Figures 8-31 and 8-33. Before connecting to your Series/1, verify signal connections in the diagrams shipped with the computer.

## Direct program control (DPC) adapter

User connections to the DPC adapter can be made in two ways-either directly to the circuit card (Figures 8-35 and $8-36$ ), or to the customer access panel (Figures 8-37 and 8-38).

Connections made directly to the DPC adapter card require three $2 \times 20$ connectors (Berg Electronics connector 65405-013, with pin sockets 47712 , or equivalent) as shown in Figure 8-35. The connector is polarized by plugging pin-position B02.

Connections made to the customer access panel use the connector plug supplied with the internal cable. This connects the feature card to the access panel (see Figure 8-37).

Connecting to the feature card or to the access panel requires a cable with 75 twisted pairs of wire. For connecting directly to the adapter card, No. 24 AWG $(0.511 \mathrm{~mm})$ twisted-pair flat cable is recommended for easier cable routing.

Signal connections are identified in Figures 8-36 and 8-39. Before connecting to your Series/1, verify signal connections in the diagrams shipped with the computer.

## Teletypewriter adapter

Teletype Corporation models ASR-33, ASR-35, and KSR-33 teletypewriters (or equivalent devices) can be connected to the Series/ 1 teletypewriter adapter card in two ways-either directly to the circuit card (Figure 8-40), or to the customer access panel (Figure 8-44).

Connections can be made directly to the adapter card using the optional 6-meter (20-foot) teletypewriter cable shown in Figure 8-40. This cable is designed for the standard teletypewriter interface and includes the connector for the adapter card.

Connections made to the customer access panel use another optional cable. This cable includes the plug for the teletypewriter connector on the access panel (see Figure 8-44). The cable from the access panel to the teletypewriter adapter is provided with the access panel.

Teletype models ASR-33, ASR-35, and KSR-33 require 24 volts across their transmit output. For devices that require only 12 volts across their transmit output, pin B05 should be used instead of B01 at the adapter-card connector.

The teletypewriter adapter can also be used to attach other devices (such as a keyboard-display unit, printer, or plotter) to Series/1. Several interface options are available for these devices:

- Current-loop interface (with user's power supply or equivalent Series/1 $\pm$ 12-volt supply)
- Electronic Industries Association (EIA) interface
- Transistor-transistor logic (TTL) interface.

Connections to these interfaces are made directly to the adapter card with user-supplied cables and $2 \times 8$ Berg connectors (Berg Electronics connector 65405-005, with pin sockets 47712, or equivalent). Signal connections are identified in Figure 8-42.

Before connecting to your Series/1, verify signal connections in the diagrams shipped with the computer, especially EIA device-connector jumpers.

## Timer feature

User connections to the timer feature can be made in two ways-either directly to the circuit card (Figure 8-45), or to the customer access panel (Figure 8-46).

Connections made directly to the timer card require a polarized $2 \times 8$ connector (Berg Electronics connector 65405-005, with pin sockets 47712, or equivalent) as shown in Figure 8-45.

Connections made to the customer access panel (Figure 8-46) use the connector plug supplied with the access panel.

Recommended cable size is No. 24 AWG ( 0.511 mm ). Signal connections are identified in Figures 8-24 and 8-25. Before connecting to your Series/1, verify signal connections in the diagrams shipped with the computer.

Signal connections for timer feature...

## Series/1 local communication controller feature

The Series/ 1 Local Communication Controller feature (feature \#1400) fits into a Series/1 Processor or Input/Output Expansion unit and allows you to connect up to sixteen Series/1 processors.

You are responsible for supplying, installing, and maintaining cables for the feature $\# 1400$. The following shows the feature \#1400 and explains how to order and install bulk cables.

Cable connection from 1400 feature to
1400 feature see Figure 8-52
Figure 8-48. Series/1 Local Communications Controller feature

See the IBM Cabling System Planning and Installation Guide-Cable and Accessories, GA27-3361, for information about ordering and installing the IBM Cabling System.

The following table provides order information for twinaxial and coaxial cable.

| Part name | Twinaxial cable indoor or outdoor | Coaxial cable |  |
| :---: | :---: | :---: | :---: |
|  |  | Indoor | Outdoor |
| Cable Assembly ${ }^{1}$ (cable in specified length with connectors at both ends) | IBM 4498426 <br> (one male, one female) <br> IBM 7362267 <br> (2 male) <br> Vinyl <br> IBM 7362062 <br> (2 male) <br> Teflon® | IBM 2577672 <br> (two male connectors) | IBM 1833108 (two male connectors) |
| Adapter ${ }^{2}$ (cable to cable) | IBM 7362230 <br> Amphenol 82-5588 | IBM 5252643 <br> Amphenol 31-219 | IBM 5252643 <br> Amphenol 31-219 |
| Bulk Cable ${ }^{1}$ (cable in specified length, without connectors) | $\begin{aligned} & \text { IBM } 7362211 \\ & \text { Belden } \\ & 9207 \text { Vinyl } \\ & \text { IBM } 7362061 \\ & \text { Teflon® } \end{aligned}$ | $\begin{array}{r} \text { IBM } 323921 \\ \text { RG62 A/U } \end{array}$ | $\begin{aligned} & \text { IBM } 5252750 \\ & \text { RG62 A/U } \end{aligned}$ |
| Connector Kit | IBM 4498427 <br> (one male, one female) <br> IBM 7362268 <br> (2 male) for Vinyl cable <br> IBM 7362063 <br> ( 2 male) for Teflon® cable | IBM 1836418 <br> (two male connectors) | IBM 1836419 (two male connectors) |
| Connector (single male) | IBM 7362229 <br> Amphenol 82-5589 | IBM 1836444 <br> Amphenol 31-4541 <br> Bendix 30220-3 | IBM 1836447 <br> Amphenol $31-4542$ <br> Bendix 39100-16 |
| Station Protector | IBM 7362426 | IBM 7362427 |  |
| Adapter ${ }^{3}$, (single) (twinaxialcoaxial) | IBM P/N 7363102 |  |  |
| Connector (single female twinaxial) | IBM P/N 6838959 <br> Amphenol 82-5591 |  |  |

${ }^{1}$ Specify the total length of each cable required when ordering. For example, total length $=(0.6 \mathrm{~m}+1 \mathrm{~m}[2 \mathrm{ft} .+3.3 \mathrm{ft}])+($ distance from table to host system $)$. $(0.6 \mathrm{~m}+1 \mathrm{~m}[2 \mathrm{ft} .+3.3 \mathrm{ft}])=$. additional clearance for serviceability and cleaning. $)$ (See Station Protectors for sample station protector installation information.)
${ }^{2}$ Order one for coaxial cable.
${ }^{3}$ Order two for coaxial cable.

Figure 8-49. Cable connections for feature 1400

## Cable routing for feature \# 1400

Figure 8-50. Cable routing for feature 1400

Figure 8-51. Feature 1400 sample configuration

Figure 8-52. Customer supplied cable attachment

## Cable Considerations

- You can use twinaxial coaxial, or IBM Cabling System cables with connectors for coupling the attachment to the customer supplied cables.
- The local communication controller feature line drivers allow a maximum cable length between features of 1,525 meters ( 5,000 feet) for IBM Cabling System cables for twinaxial, and 610 meters ( 2,000 feet) feet for coaxial before the line signal must be received or retransmitted by another local communication controller feature.
- It is recommended that the maximum distance between the LCC and the distribution panel not exceed 100 meters, ( 328 feet) in a building with two or more distribution panels, or 300 meters, ( 985 feet) in a building with one distribution panel.
- See the IBM Cabling System Planning and Installation Guide-Cable and Accessories, GA27-3361, for information about installing the IBM Cabling System cable and recommended cabling limitations.
- Do not mix cable types (twinaxial, coaxial, or IBM Cabling System) between attachments.
- Do not splice cables; use cable connectors.
- Attached cable connectors should be covered with shrink tubing to prevent accidental grounding of the connection
- Twinaxial cable can be ordered in a maximum length of 610 meters (2,000 feet).
- You can have up to four cable junctions between attachments.

## Cable Splicing

Do not splice cables; instead, use connectors (IBM parts 6838959 and 7362229) or an equivalent for twinaxial cable and adapter IBM part 5252643, Amphenol part 31-219, or an equivalent for coaxial cable.

The attached cable connectors should be covered with shrink tubing to prevent accidental grounding of the connection. Figure 8-53 illustrates the cable adapter for joining twinaxial cables, and Figure 8-54 illustrates the cable adapter for splicing coaxial cables.

${ }^{1}$ Specify the total length of each cable ordered.
Figure 8-53. Cable splicing for twinaxial cables

Figure 8-54. Cable adapter for splicing coaxial cables

## Outdoor Cable Installation

You can use twinaxial or coaxial cable indoors or outdoors. (There are two types of coaxial cable to accommodate indoor and outdoor use.) For twinaxial or coaxial cable, you need some type of carrier to provide support every 3 meters ( 10 feet) for overhead installation. Twinaxial cable is not recommended for direct burial (without conduit).
Outdoor connections are permitted only if the connections are potted in weatherproof compound. Also, for protection from lightning, you must attach a station protector (see Station Protectors) at each end of the cable that is run outdoors (for buried and overhead cables). Following is a list of suggested outdoor installation methods for twinaxial or coaxial cable. They are listed in the order that provides the greatest protection:

- Cable buried in grounded metal conduit.
- Overhead, shielded cable. This shield, which is in addition to the shield in the coaxial or twinaxial cable, should be grounded at each end and at each pole, if possible.
- Cable buried in metal conduit.
- Cable buried in nonmetallic conduit.
- Overhead cable on a carrier with the carrier grounded at each end and at each pole.
- Overhead cable under a shield line. The shield line is a metal cable run on the same poles. (Power lines can also have a shielding effect on cables.) The coaxial or twinaxial cable should hang at least 1 meter ( 3 feet) below the shield line and should be suspended on nonconducting hangers.

Note: For overhead cables, avoid having the coaxial or twinaxial cable as the highest point in the area. See Wiring Methods in this chapter for routing signal cable information.

## Station Protectors

Station protectors are required for each outdoor or underground circuit run. A station protector provides for grounding of the cable shield for personnel safety. It also contains solid state components for unit protection. Station protectors must be installed indoors where the cable enters or exits the building. They should be as close as close as possible to a suitable ground. As defined by the National Electric Code (NEC), Article 500, station protectors must not be installed where combustible materials or other hazardous conditions exist; therefore, areas where cables enter and leave the building must meet NEC standards. Also, the station protector must be grounded at the building entrance or exit point (reference Article 800-31 in NEC).

You are responsible for supplying, installing, and maintaining station protectors. You can order a Twinaxial Station Protector Kit or a coaxial Station Protector Kit from IBM. (A kit consists of two station protectors and is sufficient to install one outdoor cable with a station protector at each end).

You can order single station protectors using IBM part 7362426 for twinaxial cable or IBM part 7362427 for coaxial cable.

If you want to connect the station protectors to your lines before the Local Communications Controller feature arrives, order the station protectors separately from your IBM representative, specifying a date earlier than the ship date.

Install the station protectors so that the components in them can be easily inspected and maintained, but cannot be accessed by unauthorized persons who might come in contact with them. During lightning storms, do not handle the station protectors or cable that runs from the protector to the terminal.

Note: Cables are attached to the station protectors using two connectors, IBM part 7362229 or equivalent. Therefore, modify cables fabricated with connector IBM part 6838959, or equivalent, at the station protector end by removing connector 6838959 and replacing it with connector IBM part 7362229, or equivalent.

## Grounding Recommendations

You must provide good grounding (grounding conductor and grounding electrode) for the station protector. Following is a list of the minimum recommended requirements for station protector grounding. The grounding conductor should be:

- AWG 6-gauge wire or larger
- Less than 3 meters ( 10 feet) long
- Run in a straight line to a grounding electrode that has a ground resistance of less than 0.10 ohms.

Also provide common grounding among the station protector, the utility ground, and all extensive metal components in the vicinity of the system to prevent side flashes caused by lightning. The conductor used for interconnecting grounds should be at least AWG 6-gauge wire.

## Station Protector Installation Requirements

The station protector should be installed in line with the cable as it enters or exits a building and should be permanently mounted in the building (see Figure 8-55). An example of station protector installations is shown in Figure 8-56.

## Vibration limits

It is your responsibility to ensure that vibration does not exceed the specified levels. IBM feature \#1400 is designed to operate within the following limits. If these vibration specifications are met, the feature \#1400 specifications will be satisfied. See the vibration and shock level graphs in Chapter 9 for additional information.

| $5-13 \mathrm{~Hz}$ continuous transient | $\begin{aligned} & =0.762 \mathrm{~mm}(0.030 \mathrm{in} .) \\ & \text { double amplitude } \\ & =\begin{array}{l} 1.016 \mathrm{~mm}(0.040 \mathrm{in} .) \\ \text { double amplitude } \end{array} \end{aligned}$ |

## Telephone Communication Controller Feature 7880

You need a Data Access Arrangement (DAA) or a Voice Connecting Arrangement (VCA) ${ }^{5}$ to connect Telephone Communication Controller \#7880 and communication adapter \#7881 (Figure 8-57) to the telephone line.

Use the RPQ 8D0036 cable assembly to connect the Telephone Communication Adapter \#7881 to a 1750/3750 Switching System. ${ }^{6}$ The IBM Audio Distribution System Administrator's Guide gives more information about connecting this adapter.

## Customer DAA/VCA

 connections- Cable feature \#2070 connects to the DAA (see Figure 8-58)
- Cable feature \#2071 connects to the VCA (see Figure 8-59)
- DAA and VCA installation instructions are supplied with each unit (see Figure 8-61 and 8-62).

[^7]Series/ 1 processor (or I/O expansion unit) cards

See Figure 8-58 and Figure $8-59$ for cable connections of features 2070 and 2071. See Figure 8-60 for cable routing.
Figure 8-57. Telephone communication controller attachment features

See Figure 8-60 for cable routing
See Figure 8.61 for connection of DAA

## Note...

Customer option - If line busy is required for a non-operational port.

Series/ 1
processor (or I/O expansion unit)

See Figure 8-59 for pin connections
*The VCA can use various connecting services. Consult the documentation of the specific VCA selected for cable options.

Figure 8-62. VCA connection example

## Multifunction Attachment Feature

The Multifunction attachment feature 1310 card can be plugged into a Series/1 processor or I/O expansion unit. The attachment provides four serial input/output (I/O) ports for the connections of the following devices:

- IBM Series/1 4975 printers, models $1 \mathrm{~L}, 1 \mathrm{R}, 2 \mathrm{~L}$, and 2R
- IBM 3101 Display terminals, models $10,12,13,20,22$, and 23 using RS-232-C interface and models 13 and 23 using RS-422-A interface
- Asynchronous/synchronous terminals using the RS-232-C interface
- A binary synchronous terminal or host system using the RS-232-C interface
- A combination of up to four IBM 3101 Display terminals and/or 4975 printers, using the RS-422 interface, can be configured for local attachment mode.

Additional information about IBM Series/1 4975 printers can be found in IBM Series/1 4975 Printers and Multifunction Attachment Feature Description, GA34-0144. Figure 8-63 shows feature 1310 and Figure 8-64 shows a sample configuration.

## Cable considerations

You can use either IBM Cabling System cable and accessories or 22 gauge dual shielded twisted pair cable (see Card and connector table, Page 6-12). connect feature 1310 to the following:

- IBM 3101 Display Terminal Models 13 and 23 with the RS-422A interface.
- 4975 Printer Models 01L and 02L with the RS-422A interface.

For IBM Cabling System cable, the distance between feature 1310 and the distribution panel should not exceed 100 meters ( 328 feet). Total IBM Cabling System cable length cannot exceed 600 meters (2,000 feet). See IBM Cabling System Planning and Installation Guide-Cable and Accessories, GA27-3361, Chapter 4, for information about installing IBM Cabling System cable.

Do not install cable outdoors for a feature 1310,3101 Display Terminal or IBM 4975 Printer.

## Vibration limits

It is your responsibility to ensure that vibration does not exceed the specified levels. IBM feature 1310 is designed to operate within the following limits. See the vibration and shock level graphs in Chapter 9 for additional information.

| 5-17 Hz continuous transient | $\begin{aligned} &= 0.914 \mathrm{~mm}(0.036 \mathrm{in} .) \\ & \text { double amplitude } \\ &= 1.22 \mathrm{~mm}(0.048 \mathrm{in} .) \\ & \text { double amplitude } \end{aligned}$ |
| :---: | :---: |
| $17-200 \mathrm{~Hz}$ continuous transient | $\begin{array}{r} =0.55 \mathrm{G} \text { peak } \\ \text { acceleration } \\ =0.73 \mathrm{G} \text { peak } \\ \text { acceleration } \end{array}$ |
| $200-500 \mathrm{~Hz}$ <br> continuous <br> transient | $\begin{aligned} &= 0.25 \mathrm{G} \text { peak } \\ & \text { acceleration } \\ &= 0.33 \mathrm{G} \text { peak } \\ & \text { acceleration } \end{aligned}$ |

## Printer attachment-5200 series (feature 5640)

The attachment for the 5200 series printers (feature 5640) fits into a Series/1 processor or I/O expansion unit and connects up to eight 5200 series printers to the Series/1.

The attachment has two ports. A Cable-thru feature on the printer lets you connect up to seven printers to a single port. A twinaxial cable up to 1525 meters ( 5000 feet) in length connects the attachment to the printers.

When all printers are the same type, there are three possible configurations:

- Up to eight 5219s.
- Up to eight 5224s.
- Up to four 5225 s .
- Up to two 5262s.

You can connect the printers to the attachment in one of the following ways:

- Any mix of up to eight 5219 and 5224 printers.
- One 5225 printer and any mix of up to seven 5219 and 5224 printers.
- Two 5225 printers and any mix of up to five 5219 and 5224 printers.
- Three 5225 printers and any mix of up to three 5219 and 5224 printers.
- Four 5225 printers and one 5219 or 5224 printer.
- One 5262 printer and up to five 5219 printers.
- Two 5262 printers and up to three 5219 printers.

Note: All printers within a physical distance, not cable length, of 30.5 meters ( 100 feet) of the attachment must be the same machine type, regardless of the port they are attached to. Printer machine types can be mixed only at distances of at least 30.5 meters from the attachment. At the 30.5 meter distance or more, there are no restrictions on distances between printer machine types.

Figures 8-71,8-72, and 8-72A show three sample configurations for feature 5640.

You can order a 6-meter (20-foot) cable with connectors (feature 5780) from IBM. If you supply your own cables, you can order a $2 \times 4$ Berg connector kit (part number 6095524) from IBM. See "Twinaxial cable assembly" on page 8-26 for twinaxial cable specifications.

On 5200 series printers that support cable-thru to additional printers, there will be two connectors for attaching cables, a switch for terminating a string of printers, and a set of three switches for specifying a unique printer address. The location and use of those items may vary within the 5200 family of printers. For specific information regarding operation of printers within the 5200 printer
family, users should refer to the Operators Guide for each printer. The last printer in a string of printers has only one cable connected to it and must have the terminate switch set to the terminate position. All other printers have two cables connected and must have their terminate switches set to the cable-thru data-pass-thru position.

Each address switch in a string of printers must be set to its own unique value that
matches the assigned address in the host application program.

Example:
printer address $=2$

Figure 8-76. Card file cable installation for feature 5640

## Outdoor Cable Installation

A list of methods for installing twinaxial cable follows. The methods appear in the order that provides the greatest protection.

- Cable buried in grounded metal conduit.
- Overhead, shielded cable in addition to the shield in the twinaxial cable. It should be grounded at each end and at each pole, if possible.
- Cable buried in metal conduit.
- Cable buried in nonmetallic conduit.
- Overhead cable on a carrier with the carrier grounded at each end and at each pole.
- Overhead cable under a shield line. The shield line is a metal cable run on the same poles. (Power lines can also have a shielding effect on cables.) Hang the cable at least 1 meter ( 3 feet) below the shield line, and suspend it on nonconducting hangers.

When installing cables overhead, use a carrier every 3 meters ( 10 feet) of the cable length to support the cable. Also, avoid
having the cable as the highest point in the area. See Wiring Methods in this chapter for routing signal cable information.

If you connect the cables outdoors, seal the connections in a weatherproof compound.

## Vibration limits

It is your responsibility to ensure that vibration does not exceed the specified levels. IBM feature \#5640 is designed to operate within the following limits. See the vibration and shock level graphs in Chapter 9 for additional information.

| $5-17 \mathrm{~Hz}$ continuous transient | $\begin{aligned} & =0.914 \mathrm{~mm}(0.036 \mathrm{in} .) \\ & \text { double amplitude } \\ & =1.22 \mathrm{~mm}(0.048 \mathrm{in} .) \\ & \text { double amplitude } \end{aligned}$ |
| :---: | :---: |
| $17-200 \mathrm{~Hz}$ continuous transient | $\begin{aligned} & =0.55 \mathrm{G} \text { peak } \\ & \text { acceleration } \\ & =0.73 \mathrm{G} \text { peak } \\ & \text { acceleration } \end{aligned}$ |
| $200-500 \mathrm{~Hz}$ continuous transient | $\begin{aligned} & =0.25 \mathrm{G} \text { peak } \\ & \text { acceleration } \\ & =\begin{array}{l} 0.33 \mathrm{G} \text { peak } \\ \text { acceleration } \end{array} \end{aligned}$ |

## Cable Splicing

Do not splice cables; instead, use connectors (IBM parts 6838959 and 7362229) or an equivalent for twinaxial cable. Cover the cable connectors with shrink tubing to prevent accidental grounding of the connection.

Figure 8-77 illustrates the cable adapter for joining twinaxial cables.

${ }^{1}$ Specify the total length of each cable ordered.
Figure 8-77. Cable splicing for twinaxial cables

## Station Protectors

Station protectors prevent the cable and equipment from lightning damage.

Use protectors for outdoor cable installations and for installing indoor cables over 60 meters (200 feet) in length.

You can order single station protectors using IBM part 7362426 for twinaxial cable. Use two connectors, IBM part 7362229 , to connect the cables to the protectors.

Keep the station protectors away from combustible materials or other hazards (see National Electric code, article 500). Also, keep station protectors away from areas where unauthorized persons can touch them. During lightning storms, do not handle the station protectors or the cable that runs from the protector to the printer.

## Grounding Recommendations

The ground conductor for the station protector should be:

- AWG 6-gauge wire or larger
- Less than 3 meters ( 10 feet) long
- Run in a straight line to a grounding electrode that has a ground resistance of less than 0.10 ohms.

Also, provide common grounding among the station protector, the utility ground, and all extensive metal components in the vicinity of the system to prevent side flashes caused by lightning. The conductor used for interconnecting grounds should be at least AWG 6-gauge wire.

## Station Protector Installation requirements

Install the station protector inside the building where the cable enters or exits the room or building (see Figure 8-78). See Figure 8-79 for an example of station protector installation.

Figure 8-78. Station protector with entering/ exiting cables

Figure 8-79. Sample station protector installation

## Multidrop workstation attachment (feature 1250)

Attachment feature 1250 plugs into a Series/1 processor or I/O expansion unit and connects the 4980 workstation to the Series/1. A Cable-thru option on the workstation lets you connect up to eight workstations to the attachment.

A twinaxial cable or IBM Cabling System cable and accessories may be used to connect the attachment to the workstations. The cable must be installed indoors. See "Twinaxial cable assembly" on page 8-26 for twinaxial cable specifications. See IBM Cabling System Planning and Installation Guide—Cables and Accessories, GA27-3361.

You can order a 6-meter (20-foot) cable with connectors (feature 5780) from IBM. If you supply your own cables, you can order a 2 x 4 Berg connector kit (part number 6095524) from IBM.

Note the following restrictions on speed vs. signal path length.

| Data rate | Max. Signal path length |
| :--- | :--- |
| 100 Kbps | 1219 meters ( 4000 feet) |
| 250 Kbps | 488 meters $(1601$ feet) |
| 500 Kbps | 244 meters (800 feet) |

In the case of twinaxial cable, cable length and signal path length are the same. However, with the IBM Cabling System, signal path length may be double the cable length. This is due to utilization of both twisted pair signal paths within the same cable.

## Vibration limits

Make sure that feature 1250 operates within the limits specified below. See the vibration and shock level graphs in Chapter 9 for additional information.

| $\mathbf{5 - 1 7} \mathrm{Hz}$ continuous transient | $\begin{aligned} = & 0.914 \mathrm{~mm}(0.036 \mathrm{in} .) \\ & \text { double amplitude } \\ = & 1.22 \mathrm{~mm}(0.048 \mathrm{in} .) \\ & \text { double amplitude } \end{aligned}$ |
| :---: | :---: |
| $\mathbf{1 7 - 2 0 0 ~ H z}$ continuous transient | $\begin{aligned} &= 0.55 \mathrm{G} \text { peak } \\ & \text { acceleration } \\ &= 0.73 \mathrm{G} \text { peak } \\ & \text { acceleration } \end{aligned}$ |
| $200-500 \mathrm{~Hz}$ continuous transient | $\begin{aligned} & =0.25 \mathrm{G} \text { peak } \\ & \text { acceleration } \\ & =\begin{array}{l} 0.33 \mathrm{G} \text { peak } \\ \text { acceleration } \end{array} \end{aligned}$ |

Preparing the Multidrop Workstation for Series/ 1

Refer to the maximum cable length table on page $8-94$ before to planning your installation.

Complete a planning form (Figure 8-81) for each 1250 attachment feature and a setup form (Figure 8-83) for each 4980 workstation on your Series/1. Use these forms to set up your 4980 workstations. Also see IBM 4980 Display Station Setup
Procedures, GA21-9297, for 4980 installation procedures.

Multidrop Workstation attachment planning form: Make one copy of the planning form (Figure 8-81) for each 1250 attachment on your Series/1. Use the following instructions and example (Figure 8-80) to fill out the form.

Information will be different for each attachment. Make sure that you complete a separate form for each.

1. Enter the location of each workstation (11. You can connect up to eight workstations to an attachment.
2. Enter the Series/1 device address for each workstation [2]. Addresses range from 60 through 67 (hexadecimal).

Note: Jumpers have been installed on the first attachment card for Series/1 device addresses 60 through

67 (hexadecimal). The base address is 60 and the domain (the number of Series/1 addresses reserved by the attachment) is eight. The base address of each additional attachment card increases by a value of hexadecimal 8. Refer to the following table if you wish to change a device address. X can be 0-F hexadecimal.

| Number <br> of addresses <br> in the domain | Base addresses <br> permitted (hexadecimal) |
| :---: | :--- |
| 1 | XX |
| 2 | X0, X2, X4, X6, X8, XA, XC, XE |
| 4 | X0, X4, X8, XC |
| 8 | X0, X8 |

3. Enter the workstation address for each workstation 3. Addresses range from 01 through FE
(hexadecimal). Each address on a port must be unique.
4. Enter the label identification for each cable ${ }^{7}$ (4).
5. Enter the signal path length 5 .
6. Check whether the signal path length is measured in meters or feet
7. Enter the total of the signal path segment lengths for each signal path length (enter 0 if cable is not used) [7].
8. For port 0 , enter the data rate for the longer signal path length (@)

[^8]
${ }^{1}$ Addresses shown are hexadecimal
Figure 8-80. Sample Multidrop Workstation attachment planning form

Figure 8-81. Multidrop Workstation attachment planning form

Workstation setup form: Make one copy of the setup form (Figure $8-83$ ) for each workstation to be attached. Use the following instructions and example (Figure $8-82$ ) to fill out the form.

Information will be different for each workstation attached. Make sure that you complete a separate form for each.

1. Copy the information you filled in for the following items on the Multidrop Workstation attachment planning form (Figure 8-81).

## Copy from Multidrop

Workstation attachment
planning form
(Figure 8-81)
(11) Location
(6) Data rate
(3) Workstation address
(4) Cable identification

Copy to Workstation setup form
(Figure 8-83)
i1 Location
(0) Data rate
(3) Workstation address
(4) Cable identification
2. Mark (x) the Speed Select switches for the data rate you entered in 2]. Switch settings for various data rates are shown below.

ART-8080

Note: You can connect up to eight workstations on each cable run from the 1250 attachment. You should set up the workstations in sequence, beginning with the first workstation connected to the 1250 attachment.
3. Use the following table to mark (x) the address switches 6 for the workstation address you entered in (3). A workstation address consists of two characters. An example is 03. To mark the address switches for 03, you would mark switch positions $1-4$ for the first character (0).

You would then mark switch positions 5-8 for the second character (3). See the following table for switch positions of the first and second characters of a workstation address.
4. Fill in your name and phone number so that the person who sets up the workstations can contact you if he or she needs further information图.

## Chapter 9. Supporting information

This chapter contains information that supports the other chapters of this manual. Included here are...

- Miscellaneous information
- Tables and charts used in several of the other chapters
- Extra copies of worksheets and forms that you may remove or copy

## Product and safety standards

Various product and safety standards (or codes) apply to the installation of a Series/1 at a customer site. The customer is responsible for complying with all applicable national and local standards.

The following chart shows U.S. standards that apply to procedures in this manual. Consult equivalent or other applicable standards when installing a Series/1 in countries other than the U.S.

## U.S. product and safety standards

National Fire Protection

Association (NFPA) standards...

- Carbon Dioxide Extinguishing Systems, NFPA Standard No. 12
- Halon Extinguishing Systems, NFPA Standard No. 12A
- Inhalation Anesthetics, NFPA Standard No. 56A
- National Electric Code, NFPA Standard No. 70
- Electronic Computer/Data Processing Equipment, NFPA Standard No. 75
- Static Electricity, NFPA Standard No. 77
- Purged Enclosures, NFPA Standard No. 496.

Other standards...

- National Electric Manufacturers Association (NEMA)
- Occupational Safety and Health Act (OSHA)
- Racks, Panels, and Associated Equipment, Electronic Industries Association (EIA) Standard RS-310-B
- Underwriters' Laboratories (UL) Listing, UL-478

Topic or procedure (in this manual)...
Air quality
Purging and pressurizing a room . . . . . NFPA No. 496
Safety and health . . . . . . . . . . OSHA
Communications wiring . . . . . . . . NFPA No. 70 (NEC, Article 800)
Emergency-power controls . . . . . . . NFPA No. 75
Fire protection and control
Fire detection equipment . . . . . . . OSHA
Portable fire extinguishers . . . . . . . NFPA No. 75
Total-flooding systems . . . . . . . . NFPA No. 12; NFPA No. 12A; OSHA
Floor-covering resistance (use resistance . . . NFPA No. 56A (Section 4628)
values in chapter 2 of this manual)
Hazardous locations . . . . . . . . . . NFPA No. 70 (NEC, Article 500); OSHA
Lightning protection . . . . . . . . . NFPA No. 70 (NEC, Article 800)
Low-voltage signal wiring . . . . . . . . NFPA No. 70 (NEC, Article 725)
Non-IBM rack enclosure . . . . . . . . EIA RS-310-B; UL-478
Outlet (receptacle) specifications . . . . . NEMA
Power and grounding . . . . . . . . . NFPA No. 70; NFPA No. 75
Site construction . . . . . . . . . . . NFPA No. 75

## Vibration and shock levels Maximum input at base of machine

Weight in kilograms (pounds)

## Power-outlet specifications

60 Hz outlet specifications (U.S. and Canada)...

| Power outlets for Series/1 <br> standalone units <br> (3-wire, grounding, non-locking) | Power outlets for Series/1 <br> rack enclosures <br> (3-wire, grounding, locking) |
| :---: | :---: |
| $115 \mathrm{~V} / 120 \mathrm{~V}, 15 \mathrm{~A}$ | $115 \mathrm{~V} / 120 \mathrm{~V}, 20 \mathrm{~A}$ |
| NEMA 5-15R | NEMA L5-20R |
| 208V/230V/240V, 15A | $208 \mathrm{~V} / 230 \mathrm{~V} / 240 \mathrm{~V}, 20 \mathrm{~A}$ |
| NEMA 6-15R | NEMA L6-20R |

NEMA $=$ National Electric Manufacturers Association

50 Hz and 60 Hz power specifications for countries other than U.S. and Canada...

- 50 Hz power uses blue wire for neutral.
- 15A single-phase circuit is required for all Series/ 1 standalone units.

20A single-phase circuit is required for Series/ 1 rack enclosures.

Rack enclosures, standalone units, and rack units that are not mounted in a 4997 are shipped without power plugs attached to the power cords.
If national or local standards require direct wiring of power cords, complete power-cord wiring before calling the IBM CE for final installation.

World Trade Countries (Except Canada) Plugs - Customer Setup Units Only

- The following plug, designated by country, will be installed on your machine

| Country | Plug <br> number | Country | Plug <br> number |
| :--- | :--- | :--- | :--- |

## Rack enclosures

Series/1 rack-mounted units are designed to fit a 483-millimeter (19-inch) rack enclosure. (See this Chapter for applicable U.S. standard).

## IBM rack enclosure

The 4997 Rack Enclosure is designed to meet the mounting requirements of Series/1 units. Refer to Figures 9-1 and 9-2.

## Non-IBM rack enclosure

If you are planning to use a non-IBM rack enclosure for your Series/ 1 units, the non-IBM rack enclosure must have the following:

- Have equivalent mounting hardware and unit service access to the IBM 4997 (Figure 9-3).

IBM 4997 Rack Enclosure Model 1

Figure 9-1. IBM rack enclosures

- Conform to the dimensions specified in this section (Figure 9-4).
- Present no safety hazards to the IBM customer site representative.

IBM will install and service Series/1 units (except 4969) in a non-IBM rack enclosure when the above requirements are met. If these requirements are not met, the customer is responsible for mounting Series/ 1 units in a non-IBM rack enclosure. IBM will not assemble or alter a non-IBM rack enclosure to install Series/1 units.

IBM 4997 Rack Enclosure Model 2

## IBM 4997 Rack Enclosure Model 2

- Series/1 rack-mounted units fit into a $483-\mathrm{mm}$ (19-inch) rack enclosure (see page 9-1 for the applicable U.S. standard).
- The 4997 Rack Enclosure meets the mounting requirements of the Series/ 1 units.

Figure 9-2. IBM 4997 Rack Enclosure Model 2

## Non-IBM rack-enclosure requirements

The chart below lists the rack-enclosure features required for IBM installation and service of Series/ 1 units in a non-IBM rack enclosure. The numbers in the first column of the chart refer to the equivalent items in the 4997 (see Figure 9-2).

- All Series/ 1 units in a non-IBM rack enclosure must be supported independently of the front mounting screws for IBM to complete installation and to service. Otherwise, the customer needs to mount the units in the rack and reposition racks or units as necessary for IBM installation and service.

| Figure 9-2 ref. | Non-IBM rack enclosures |  |
| :---: | :---: | :---: |
| 1 | Screw ho | equired |
| 2 |  | Pequired |
| 3 | Horizontal unit supports (Apparatus supports) | Required |
| 4 | Vertical support columns | Required (four) |
| 45 | Vertical support-column spacing for $483-\mathrm{mm}$ (19-in) rack units | Required |
| 6 | Vertical support-column spacing for a $4962,4963,4966,4967$, or 4969 | Required |
| 7 | Enclosure vents | Required |
| 8 | Tilt stabilizer | Required |
| 9 | Rack adapter for half-width units (4952A, 4954A, 4964, 4982, 4999) | As required |
| 10 | Casters and leveling pads | Recommended |
| 11 | User-cable opening | Required |
| 12 | User-cable routing area | Required |
| 13 | Enclosure covers | Required |
| 14 | Primary power and ground distribution | Required |
| - | Fits standard $2.03-\mathrm{m}$ ( $6-\mathrm{ft}, 8-\mathrm{in}$ ) door | Recommended |
| - | Strength to support total weight | Required |
| - | Welded frame | Recommended |
| - | Qualifies as computer enclosure | Recommended |

Figure 9-3. Non-IBM rack-enclosure requirements

## Non-IBM rack-enclosure dimensions

These dimensions are required for non-IBM rack enclosures that will mount Series/1 units.

## Typical non-IBM rack enclosure

Top view

Required dimensions:
$A=610 \mathrm{~mm}$ (24 in)
required for mounting 4962, 4963, 4966, 4967, 4968, 4969
B $=711 \mathrm{~mm}(28 \mathrm{in})$
minimum rack depth
C $=451 \mathrm{~mm}(17-3 / 4 \mathrm{in})$
$D=465 \mathrm{~mm}(18-1 / 2 \mathrm{in})$
$\mathbf{E}=483 \mathrm{~mm}$ (19 in)
F= 483 mm (19 in)
$\boldsymbol{G}=13 \mathrm{~mm}(1 / 2 \mathrm{in})$
$\mathbf{H}=16 \mathrm{~mm}(3 / 4 \mathrm{in})$
J. $=8 \mathrm{~mm}(1 / 2 \mathrm{in})$

Figure 9-4. Non-IBM rack-enclosure dimensions

Dimensions of Series/1 rack-mounted units

|  | Rack-mounted units |  | Metric-dimensions (mm) |  |  | English dimensions (in) |  |  |

4955 Processor Model F 5-42
4955 Processor Models A, B, C, D, and E 5-40
4956 Processor Model B, B10, E, and E10 Rack Mount 5-44
4956 Processor Model C and C10 Rack
Mount 5-46
4956 Processor Model C and C10
Stand-Alone 5-48
4956 Processor Model E70 Rack Mount 5-50
4956 Processor Model E70 Stand-Alone 5-52
4956 Processor Model G10 Rack Mount 5-54
4956 Processor Model G10 Stand-Alone 5-56
4956 Processor Model H10 Rack Mount 5-54
4956 Processor Model H10 Stand-Alone 5-56
4956 Processor Model 30D Rack Mount 5-50
4956 Processor Model 30D Stand-Alone 5-52
4956 Processor Model 31D Rack Mount 5-50
4956 Processor Model 31D Stand-Alone 5-52
4956 Processor Model 60D Rack Mount 5-50
4956 Processor Model 60D Stand-Alone 5-52
4956 Processor Model 60E Rack Mount 5-50
4956 Processor Model 60E Stand-Alone 5-52
4956 Processor Model 61D Rack Mount 5-50
4956 Processor Model 61D Stand-Alone 5-52 4959 Input/Output Expansion Unit Model A (above serial \#22,500) 5-60
4959 Input/Output Expansion Unit Model A (below serial \#22,499) 5-58
4962 Disk Storage Unit Models 1, 1F, and 3 5-62
4962 Disk Storage Unit Models 2, 2F, and 4 5-64
4963 Disk Storage Unit Models 23A, 23B, 29A,
29B, 58A, 58B, 64A, and 64B 5-66
4964 Diskette Storage Unit Model 1 5-68

4965 Storage and I/O Expansion Unit Model 1 Rack Mount 5-70
4965 Storage and I/O Expansion Unit Model 1 Stand-Alone 5-72
4965 Storage and I/O Expansion Unit Model 30D Rack Mount 5-74
4965 Storage and I/O Expansion Unit Model 30D Stand-Alone 5-76
4965 Storage and I/O Expansion Unit Model 60D Rack Mount 5-74
4965 Storage and I/O Expansion Unit Model 60D Stand-Alone 5-76
4966 Diskette Magazine Unit Model 1 5-78
4967 High Performance Disk Subsystem Models 2CA, 2CB, 3CA, and 3CB 5-80
4968 Autoload Streaming Magnetic Tape Unit Model 1 AS 5-82
4969 Magnetic Tape Unit Models 4D, 4N, and 4P 5-84
4969 Magnetic Tape Unit Models 7D, 7N, and 7P 5-88
4973 Line Printer Model 1 5-92
4973 Line Printer Model 2 5-94
4974 Printer Model 1 5-96
4975 Printer Models 01L, 01R 5-98

4975 Printer Models 02L, 02R 5-100
4978 Display Station Model 1 (RPQ) 5-102
4978 Display Station Model 2 (RPQ) 5-104
4979 Display Station Model 1 5-106
4980 Display Station 5-108
4982 Sensor Input/Output Unit Model 1 5-110
4987 Programmable Communications
Subsystem 5-112
4993 Series/1-System/370 Termination Enclosure
Model 1 5-114
4997 Rack Enclosure Models 1A and 1B 5-116
4997 Rack Enclosure Models 2A and 2B 5-118
4999 Battery Backup Unit Model 1 5-120
4999 Battery Backup Unit Model 2 5-122

## 5

5219 Typewheel Printer Models D01 and D02 5-124
5224 Printer Models 1 and 2 5-126
5225 Printer Models 1, 2, 3, and 4 5-128
5262 Printer Model 1 5-130

This manual is part of a library that serves as a reference source for systems analysts, programmers, and operators of IBM systems. You may use this form to communicate your comments about this publication, its organization, or subject matter, with the understanding that IBM may use or distribute whatever information you supply in any way it believes appropriate without incurring any obligation to you. Your comments will be sent to the author's department for whatever review and action, if any, are deemed appropriate.

Note: Copies of IBM publications are not stocked at the location to which this form is addressed. Please direct any requests for copies of publications, or for assistance in using your IBM system, to vour IBM representative or to the IBM branch office serving vour locality.

Thank you for your cooperation. No postage stamp necessary if mailed in the U.S.A. (Elsewhere, an IBM office or representative will be happy to forward your comments or you may mail directly to the address in the Edition Notice on the back of the title page.)

## 

International Business Machines Corporation
